

Can you tell us more about your commercial display division and the digital signage products you offer?

In India, as in the rest of the world, there's a significant shift towards AI development, particularly in commercial displays and outdoor displays. In cities like New York and Shenzhen, buildings are adorned with dynamic displays capable of projecting advertisements and animations. We aim to introduce this culture in India, where there is currently no manufacturing for such displays. Our focus extends to various types of commercial displays, including outdoor displays, such as mini LED screens, which have immense potential for advertising. Additionally, we plan to venture into interactive displays, a rising trend in the market. These interactive displays are in high demand in schools, institutions, offices, and co-working spaces, where wireless connectivity and seamless presentations are essential.

How do you foresee the growth in demand for the commercial displays in India?

We have observed a significant and emerging demand for interactive displays in India. Additionally, when we engage with showroom owners and brand proprietors, we identify a pressing need for commercial displays and smart displays in the Indian market. Many of them express a desire for these products, but they face challenges in sourcing them locally. Often, they can only find such products through imports, and after a few years, they may abandon the idea due to various complexities. Our goal is to change this landscape by becoming a major supplier of these products in the Indian market. By doing so, we aim to stimulate and meet the growing demand for these displays. This shift will not only make these products more accessible to businesses and

consumers but also contribute to the development of this segment within the Indian electronics industry.

Can you provide details about the new manufacturing facility in Noida?

We believe there is a need to establish a global unit that can cater to global companies across all countries, offering comprehensive export facilities. This will allow us to compete on an equal footing with companies supplying products worldwide. Manufacturing has gradually gained momentum in India in the past five to seven years.

**“OUR NEXT STEP
WILL BE TO
EXPLORE THE
BONDING OF OPEN
CELL COMPONENTS
IN INDIA”**

I say 'gradually' because changes in duty structures have incentivised local manufacturing over complete importation of finished goods. While we continue to import raw materials, our focus has shifted towards domestic production in India over the last five to seven years. It is evident that the time has come to expand our manufacturing capabilities and construct mega factories capable of serving India and the entire world. To achieve this vision, we require top-tier equipment, state-of-the-art facilities, and significant investments in research and development. This will enable us to meet the global demand effectively. With this vision in mind, we are planning to enrich our LED TV production. We are embarking on complete backward integration, aiming to manufacture every component except semiconductors.

The scale of the new plants will be unprecedented, making them the highest capacity plants in India. We are also in discussions with some of the world's most renowned brands. We are establishing our presence in Noida for this purpose, and this is the rationale behind our decision.

Can you explain your strategy for backward integration, both current and future?

Our existing plant is not limited to just assembly; we're already engaged in some manufacturing activities. We perform injection moulding and SMT processes. With the new plant, we're planning to expand on this foundation. However, it's important to note that we can't immediately transition from raw materials to complete backward integration, encompassing semi-finished and finished goods from day one.

Now, we can engage in complete raw material processing, converting them into semi-finished goods currently imported into India. Our plan is to become India's first major manufacturer of backlights for LED TV panels, which are entirely imported right now! Our long-term vision includes gradually venturing into semiconductor manufacturing as well, as the plant becomes more viable and economically sustainable, potentially surpassing the significance of mobile manufacturing.

What will be the initial production capacity for LED TVs at the new facility, and how does it compare to the Sonipat unit?

Currently, in Sonipat, we manufacture approximately 125,000 pieces per month. Moreover, we'll get additional capacity of 25,000 pieces per day in the new plant.

Initially, in the new facility, we aim to have a production capacity of 500,000 pieces per month. However, the plant's capacity can be extended
