

To prevent rust and moisture damage, you can use absorbent granules. You can also apply a protective plastic coating or grease to keep shiny surfaces from getting scratched during transportation.

Transport companies often have rules against carrying liquids, explosives, flammable materials, or powered items. If your product contains any of these, it might need special handling. These rules can change, so it is a good idea to check with the transportation authorities if your product includes sensitive items.

Usually, products go through multiple layers of packaging. The main product goes into a retail package with a tamper-proof seal and eye-catching designs. These retail packages are then placed inside larger shipping cartons for delivery to retailers. Sometimes, these shipping cartons are loaded into shipping containers or dedicated vehicles for long-distance trips.

In some cases, we opt for reusable packaging. When this happens, it is essential to plan how to efficiently return the used packages. Collapsible packaging is one option, but another is to partner with other manufacturers and share packaging resources. Shipping containers are a great example of this kind of collaboration.

Finally, we must consider how easy it is to open the package. Unboxing should be a straightforward and enjoyable experience. Providing clear cues and easy-to-use features in the packaging can make the opening process smooth and hassle-free.

Environmental consideration.

Let us think about this for a moment: the fancy packaging that wraps up our favourite products may catch our eye, but it is not the real deal. Sadly, most of that packaging ends up as trash once we are done with it. According to a report from the World Bank, about 29% of our garbage is made up of stuff like paper, card-

Carton	Orientation			Units in Direction			Total
	L	W	H	Length	Width	Height	
				2,802	2,197	2,330	
Package	l	w	h	9	11	24	2,376
	l	h	w	9	22	12	2,376
	w	l	h	14	7	24	2,352
	w	h	l	14	22	7	2,156
	h	l	w	29	7	12	2,436
	h	w	l	29	11	7	2,233

board, and plastic that used to be packaging. In 2015, that added up to a whopping 77.9 million tons!

Now, if we look at plastic waste, things get even more eye-opening. A report from the European Commission tells us that each person generates quite a bit of plastic waste every year. In the United States, it is around 221 kilograms per person! In Europe, it is 114 kilograms on average. Japan and Korea do better, with an average of 69 kilograms per person. So, we can guess that India falls somewhere in between.

Here's the real kicker: Only 9% of all that plastic waste worldwide gets recycled. The rest either piles up in landfills, slowly breaking down into tiny, harmful bits called microplastics, or just sits there, causing problems for future generations. That is why we need to make a big effort to reduce the use of plastic in packaging, especially the kind that is used once and then thrown away.

To create a better world for our kids and grandkids, we should use less material for packaging. Whenever possible, we should go for packaging that is reusable. When that is not an option, we should explore alternatives like biodegradable and eco-friendly materials. Think of materials like coir, jute, hay, and leaves—they are all kind to our environment and have been used for packaging.

But there is more we can do!

Instead of using things like Styrofoam or foam for packaging, we can switch to corrugated cardboard. Are those blister packs made of single-use plastic? We can replace them with plant-based bioplastics or compostable materials like Polylactic acid (PLA). And for similar purposes, we can also consider using cardboard or paper mâché boards.

So, there you have it—lots of exciting ways to make packaging better for our planet and future generations. Be kinder to the Earth while still keeping our products safe and sound.

Look and feel. When you are shopping, do you ever find yourself checking out the fancy packaging of a product before you even get to see what's inside? That first impression is super important! That is why it is crucial to put as much thought into designing the package as we do into creating the product itself.

The package has a big job to do. It has to show off the cool stuff our product can do, catch your eye, and give you the right idea about what to expect. It should never make wild claims that our product can't live up to. Plus, it is a fantastic place to let know about any extra goodies we offer.

Remember our last article? We mentioned that we are offering cloud-based analysis and a weather station as optional add-ons to our main product. Well, the product package is where we will tell you all about those exciting extras.

But wait, there is more! Depending on where you are, there might be some important stuff we have to put on the package by law. In India, for instance, we have to show who made the product, where it is from, when it was made, its batch number, and how much it costs. Most stores will also want a bar code on there for easy scanning.
