Gigabit Ethernet switch revolutionises industrial automation networking

Microchip Technology has launched the LAN9662 gigabit Ethernet switch to provide automation manufacturers with a comprehensive networking

solution. The product significantly reduces the complexity and over-

head of deploying Ethernet across various industrial applications, including factory automation, smart grid, building control, transportation, etc. For industrial Ethernet solutions, the Ethernet switch comes equipped with a real time engine (RTE), which can alter the Ethernet frame while it's being transmitted. This results in rapid cyclic data rates and minimal latency. It adheres to significant industry benchmarks like the OPC unified architecture (OPC/UA) and PROFINET software stack, ensuring the precise communication needs for industrial networking. With its dual integrated PHYs, the switch ensures ultra-low latency, accommodating multiple daisy chain configurations. These PHY interfaces guarantee swift data handling within a set timeframe, creating a dependable network for automation tasks like motor, conveyor, and multi-dimensional robot control systems.

AEC-Q200 Rev E certified fuses

Littelfuse Inc has launched AEC-Q200 Rev E certified fuses. The fuses are designed to meet the rigorous circuit protection requirements of compact automotive electronics and

electric vehicle (EV) systems. The fuses are suited for various automotive electronics designs. These include

on-board chargers, power distribution units, battery management systems, high voltage DC/DC converters, ignition systems, sensing line protection, as well as infotainment and navigation systems. Furthermore, they're also apt for advanced driver assistance systems, radar, and emergency call applications. The fuses offer consistent performance with high I^2t values to handle inrush currents. They provide a wide component selection for designers to protect circuits from overloads and surges. The AEC-Q200 qualified fuses quickly respond to irregular currents, shielding electronic components. The industrial fuses work efficiently between -55°C and $+150^{\circ}\text{C}$ and are environmentally friendly, being lead-free, halogen-free, and RoHS compliant.

Enhanced input and temperature ranges for switching regulators

RECOM has introduced the R-78CK-0.5 series, capable of operating with input voltages up to 40V and across a broad-

er temperature range of up to $+100^{\circ}\text{C}$. These regulators boast an output current rating of 0.5A and have fixed output voltage options of 3.3V, 5V, 12V, and 15V. Presented as a non-isolated DC-DC converter, this compact 0.5

amp switching regulator offers efficiency and size advantages. The device operates as a

positive-to-negative converter, suitable for circuits requiring a negative voltage source. These units come with a range of safeguards, including under-voltage, short-circuit, and thermal protection. The latest version of this solution brings forth improvements such as a diminished quiescent current, a reduced allowable input-output differential voltage especially for 3.3V and 5V models, and a more compact overall size. Despite these enhancements, the standard pinout is maintained, distinguishing it from linear regulators.

Tire pressure monitoring with integrated MEMS sensor

Infineon Technologies uses proprietary glass-silicon-glass micro-electromechanical systems (MEMS) sensor technology and introduced the XENSIV SP49 tire pressure monitoring sensor in the automotive tire pressure monitoring system (TPMS) segment. It is adapted to support intelligent tire operations, including automatic on-tire position sensing, assistance with tire inflation, prompt tire blowout identification, and accurate load detection.
