

ing capabilities. We have exposure to the Chinese market, Southeast Asian market, US market, the European markets, and the Indian market.

Given Panasonic's direct presence in certain countries, could you clarify if DJK is their exclusive distributor or if there are other distributors across various regions?

While we collaborate with Panasonic through various channels, there are other distributors in different regions as well. DJK maintains its unique position in the market by establishing subsidiaries in various countries, allowing us to provide direct engineering and sales support to our customers.

Could you elaborate on DJK's unique strengths and the strategies you employ to maintain your dealership relationships?

DJK's key strength lies in our global customer base, which is continuously expanding. As mentioned before, we have established subsidiaries in multiple countries, enabling us to offer direct engineering and sales support to our customers. We have engineers located in different regions who can assist customers on-site. This combination of technical expertise and personalised support has been instrumental in maintaining our dealership relationships.

How long has DJK been in India? Could you provide insights into DJK's journey in India since its establishment and the growth trajectory you've observed?

DJK India was established in 2006, primarily serving Samsung during their mobile phone manufacturing through knockdown operations. Since then, we've experienced significant growth, with the number of customers in the electronics sector increasing from 2-3 in 2016 to 68 in 2017. Despite the challenges posed by Covid-19, our

commitment to supporting customers remains unwavering.

What advice would you offer to global customers considering investment in India?

I strongly recommend considering an investment in India today. The Indian economy is expanding, and the government's initiatives have significantly improved infrastructure. This creates a favourable environment for establishing factories and manufacturing products in India.

Could you pinpoint regions in India with high demand for your products and services?

DJK currently operates in New Delhi, Bangalore, Ahmedabad (Gujarat), and is establishing a new office in Chennai. Regions like Andhra Pradesh and Tamil Nadu are also experiencing heightened interest due to government initiatives promoting investment. Delhi and Chennai, in particular, are noteworthy for their growing customer interest.

Do you exclusively deal in new equipment, or do you also offer used equipment in the Indian market?

DJK offers both new and used equipment in India. We have a market for used equipment in Southeast Asia and Japan as well. While there was a preference for used machines in the past, the Indian market has shifted towards new equipment, often equipped with IoT features that can reduce labour costs.

How has the adoption of IoT technology been received in India, and how does DJK contribute to its implementation?

That's an interesting question. The adoption of IoT technology in the Indian market has been nothing short of remarkable. Businesses and industries have shown keen interest in harnessing the potential of IoT

and machine-to-machine communication. They recognise the value of IoT, even in a market where labour costs are competitive. DJK India, with its finger on the pulse of industry trends, has been a proactive contributor to the IoT landscape. We have consistently played a pivotal role in ushering in the latest IoT technologies to our customers. The response from our customers to our IoT offerings has been overwhelmingly positive.

Do you also help in training their team members?

Yes, we have a technical centre in Noida where we provide hands-on training to customer teams, explaining machine operation and architecture. Our aim is to empower customers with the knowledge they need. At times, we have five to ten people from a customer's team come to our technology centre and we give them hands-on training on the machines and explain the architecture to them.

In addition to Panasonic chip mounters, could you highlight a few other popular products or brands that DJK offers?

The Panasonic chip mounter is our number one product. Next in line is the Keysight ICT and FCT equipment. We also have the board handling unit, SPI (solder paste inspection) machine, automatic optical inspection (AOI) machine, reflow oven and printer. We cater to customers across the spectrum, from high-volume to low-volume production.

Can DJK accommodate customers who primarily focus on prototype-level production, and do you have equipment tailored to their needs?

Yes, we do. Some customers specifically want to focus on prototype-level production, and we can provide equipment that aligns with their requirements. We work closely with suppliers to address these specific needs.
