

### **What are some common misconceptions that people have, especially regarding chip shooters and other equipment?**

I often attend joint meetings with executives and top management of organisations. Often, there's a misconception that CPH (Chips Per Hour) is solely about price. I always emphasise the key point that performance is equally crucial for CPH (chips per hour). It's essential not to overlook performance aspects when considering these machines.

### **How do you explain this to them, especially to leaders who may focus solely on the price?**

We emphasise performance and value through the material and information we provide. While price is a consideration, low price without adequate performance doesn't align with our goal of supporting our customers' production needs effectively. We have global key customers who understand this point. We want to support our customers' production, so we emphasise the importance of performance and the value we provide through our products and after-sales support. This is a key factor for us.

### **What does production support involve, and how does DJK assist customers in optimising their production processes?**

Production support encompasses helping customers optimise their production processes, reduce down-time, and minimise changeover time to enhance overall equipment efficiency (OEE) and maximise productivity. It's a key focus for our customers, and we provide ongoing assistance. It's an integral part of our company's approach.

### **Do you also help customers in reducing wastage?**

Absolutely, assisting our customers in reducing wastage is a key aspect of our commitment to

optimising their manufacturing processes. We understand that every manufacturing operation is unique, and wastage concerns can vary significantly from one customer to another. That's why we offer tailored technical assistance. At DJK, our approach to wastage reduction extends beyond mere waste minimisation. By implementing efficient solutions and leveraging technology, we contribute to the overall productivity enhancement of our customers' manufacturing operations.

### **With the advancements in technology, such as artificial intelligence, are there machines that can detect counterfeit components and perform inspections?**

Yes, this technology is coming to India as well. We leverage technological advancements to the benefit of our customers. AI can play a vital role in detecting counterfeit components, thus preventing substandard materials from entering the production process. Many of our customers are using AI to maximise productivity. Panasonic, for example, is already utilising these capabilities. It's an exciting development.

### **What future technologies do you foresee, both globally and in Japan, that will impact the manufacturing industry?**

Yes, I believe Industry 4.0, IoT, and M2M (machine-to-machine) technologies are significant trends. Manufacturing processes will continue to shift towards adopting more advanced technologies. Automation and the use of robots will likely increase, even replacing certain manual tasks. Our headquarter is already exploring and introducing these technologies to customers.

### **Have robots been deployed in Indian manufacturing, and how are they utilised?**

Yes, robots are being employed in the Indian automotive sector for specific processes, although manual labour still dominates in some areas. Automation is gradually making inroads to enhance productivity.

### **So, manual labour is still predominant in India?**

While manual labour remains prevalent in many areas of Indian manufacturing, we are witnessing notable advancements in automation, resulting in substantial productivity enhancements. Allow me to share an interesting example: In a particular manufacturing scenario, where operations ran 24/7, operators faced the demanding task of conducting changeovers during night shifts. This predicament resulted in a notable 30% drop in productivity. However, the adoption of automated specifications and the integration of robotic solutions brought about a transformative reduction in changeover time, resulting in a remarkable surge in productivity.

### **Do you have plans in place for potential partners seeking collaboration?**

Yes, we have an open-door policy when it comes to partnering with distributors in India. We firmly believe that forging multiple partnerships will not only bolster our presence but also significantly contribute to our growth ambitions.

### **What are your growth plans for the next five years?**

Our ambitious goal is to achieve five times the sales revenue of the current year. To realise this vision, we are strategically planning to establish satellite offices in various countries and regions. These offices will be equipped with dedicated sales staff, skilled engineers, and adept site managers, all working collaboratively to drive our growth agenda. **EFY**
