

BRIDGING THE COSMOS:

Protecting The Satellite Constellations In The Era Of Cyber Threats

In a cosmos, both limitless and vulnerable, securing satellites is our cosmic quest. With technological ingenuity and global cooperation, we safeguard our celestial future. This article unveils the vital strategies, merging technology, law, and security for cosmic protection

An Illustration of space satellite network

DEVANSHU JHA, an accomplished technical consultant, researcher, and adviser, has made significant contributions to various international organisations and forums like the IYNC, SOHO, IPAC Extragalactic, CTBTO, ENGYF, United Nations, SCO, COP-26, BRICS, UNOOSA, and ASEAN Youth Summit. His expertise is reflected in the publication of approximately 75 research papers

In this ever-changing era, satellites are undergoing a remarkable transformation as they become increasingly interconnected, resembling a vast network of digital nodes floating above us. However, this digital connectivity comes at a cost: vulnerability to cyber threats that can penetrate these intricate technological webs. Just like any other advanced system, satellites are not immune to cyber-attacks and must grapple with the same risks and challenges.

One notable development in the satellite industry is the emergence of large constellations comprising numerous satellites launched into Low Earth Orbit (LEO). While this advancement promises enhanced global connectivity and expanded capabilities, it also raises

enduring concerns among diverse groups of stakeholders.

Traditional satellite operators, who have long been the custodians of the space domain, find themselves faced with novel challenges. These challenges involve managing the complexities of operating and maintaining large constellations and protecting them from malicious cyber intrusions.

The scientific community, particularly astronomers, also voice their apprehensions. The proliferation of satellites in LEO can have adverse effects on astronomical observations, disrupting the delicate balance of our exploration of the cosmos. The increased presence of satellites in the night sky can obstruct celestial observations and hinder our understanding of the universe.
