

HarmonyOS: An Operating System Running Ahead Of Its Time

Every smart device today runs on some form an operating system (OS) but often some of the devices being used run on different OS. This makes it hard to integrate them and make the devices communicate with each other to accomplish a particular task. HarmonyOS brings this nuisance to an end while supplementing the overall user experience. Read on for further information on the subject

HarmonyOS is an operating system (OS) for all the smart devices that are out there. The tagline for HarmonyOS reads, “One as all, all as one.” It suggests that it is an OS capable of seamlessly running on multiple devices such that a single device can be used to access multiple devices, while making them function like a single device at the same time.

Let us first understand why it was needed in the first place. Some of these needs are:

1. IoT (internet of things) devices have seen substantial growth over the past few years along with the saturation of smartphone devices. This is one of many prospects that brings about the need for an OS that collaborates harmoniously with smartphone devices.

2. Operating systems are simply fragmented. There are different operating systems available that have been made by different vendors for various forms of devices, such as mobile phones, tablets,
