

able in high-radiation environments. The high bandwidth and ultrafast clock speed make the MRAM suitable for use in critical applications that require low power, low latency, and high security. EMxxLX MRAM devices offer SRAM-like performance with low latency, maintain memory without requiring power, and have extremely high endurance. The devices are suitable for applications such as process automation and control, aeronautics/avionics, medical, and gaming.

Low-power ReDriver

PI2MEQX2505 from Diodes Incorporated (Diodes) is a low-power 1.8V, 2.5Gbps, 4 data lane ReDriver that supports MIPI D-PHY protocols.

Developed for low powered mobile and

IoT applications, it consumes 135mW in active mode, 5mW in low-power mode, 2mW in ultra-low power mode, and only 0.2mW in standby mode. This helps to extend the battery life of portable devices that include MIPI cameras, such as laptops and personal computers. The PI2MEQX2505 is supplied in a tiny TQFN-28L (ZH) package, measuring only 3.5mm x 5.5mm, to enable high-density channel routing. It enables longer PCB trace lengths while reducing signal latency and minimising cost and power.

Front-end receiver module

NXP BTS7202U is a front-end receiver module (RX-FEM) that can fulfill

the processing speed for a network. The module offers two independent channels that can meet 5G require-

ments and has an operational range of 3.3 to 4.2GHz. Both

the independent receiver channels available in the module feature a low-noise amplifier (LNA). The front-end module is implemented using the NXP's silicon germanium (SiGe) process, which offers improved linearity and reduced noise figures to support better 5G signal quality. The module is available in an HVQFN40 package that measures 6mm x 6mm x 0.85mm and has ESD protection on all pins. It is ideal for 5G massive MIMO and wireless infrastructure applications.

Three-phase gate driver

Texas Instruments' DRV8300U gate driver is 100V, three half-bridge gate drivers,

capable of driving high-side and low-side N-channel power MOSFETs.

The driver generates the correct gate drive voltages using an integrated bootstrap diode and external capacitor for the high-side MOSFETs. The gate drive architecture supports peak up to 750mA source and 1.5A sink currents. It is suitable for use in e-scooters, drones, cordless power tools, etc.

ASFETs with enhanced SOA

Nexperia has introduced 30 new hotswap application-specific MOSFETs

(ASFETs) with enhanced soft operating area (SOA). These offer enhanced safety against in-rush currents and offer extremely low RDS(on). The ASFETs can be used in 12V hotswap applications, including data centre servers and communication equipment.

The device delivers 2.2x stronger SOA (12V @100ms) than previous technologies while having

an RDS(on) (max) as low as 0.7mΩ. The Spirito effect (represented by the steeper downward slope found on SOA curves at higher voltages) has been eliminated, while exceptional performance is maintained across the full voltage and temperature range (compared to unoptimised devices).

Compact power inductors

Vishay Intertechnology has introduced three new inductors to its IHHP series of low-profile, high-current power inductors in compact 0603, 0805, and 0806 case sizes. The inductors

combine low DCR and core losses with a low maximum height

of 0.8mm. The Vishay Dale IHHP-0603ZH-01, IHHP-0805ZH-01, and IHHP-0806ZH-01 are designed to save space and increase efficiency. These are optimised for use in DC/DC converters and power supply modules for notebook PCs, tablets, IoT, and other handheld battery-powered electronics. The magnetic-alloy power inductors offer low acoustic noise and provide
