

data analytics solution designed to enhance productivity and minimise downtime. Capable of monitoring the

performance of multiple collaborative applications simultaneously

and in real time, WebLytics gathers equipment data from both robots and tools and transforms it into easy-to-understand, visualised device and application-level intelligence. It identifies trends in real time in the robot cell, including patterns, peaks, and disturbances in application productivity.

RISC-V automated testing studio

The Embedded Studio for RISC-V adds support for 64-bit RISC-V CPUs, including RV64I, RV64G/RV64E, and RV64GC/RV64EC with floating-point

unit. It comes integrated with SEGGER's emRun C/C++ runtime and emFloat floating-point libraries, the

SEGGER Linker and the

SEGGER Compiler, which together generate compact and highly efficient code. For maximum flexibility and compatibility, the GNU compiler and linker are also included. Embedded Studio's built-in debugger natively supports J-Link and a full-fledged simulator, ideal for automated testing.

GUI tool

The TouchGFX Version 4.18 for user-interface development with STM32

microcontrollers (MCUs) offers video playback, enhanced tools for multi-

developer collaboration, and support for new X-NUCLEO display kits. By allowing playback of Motion-JPEG (MJPEG) video files, TouchGFX brings

enhancements to small devices like home-automation products, wearables, medical devices, and industrial sensors, allowing rich features such as instructional guides or entertaining startup and pause screens to enhance the user interface.

Graphics library and studio tool

The PSoc 6 family of microcontrollers is enhanced with the Embedded

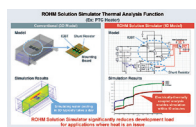

Wizard's graphics library and studio tool. The Embedded Wizard's Graphics

Engine is ModusToolbox-compatible and runs on the CY8CKIT-062S2-43012 development kit with a complete user guide and support for Embedded Wizard Studio. PSoc 6 designers can improve the end-user experience with graphic user interfaces (GUIs) that can be easily deployed to their hardware with a smaller memory footprint for use cases such as voice and graphics targeting wearables, white appliances, and more.

Electronic circuit simulator

ROHM Solution Simulator now has a new thermal analysis function that allows designers of electronic circuits and systems in the automotive and industrial markets to collectively verify power devices' and driver ICs' thermal issues

on different solution circuits. The simulator makes it possible to carry out a variety of simulations—from component selection to individual device and even system-level verification. This enables easy and accurate verification of ROHM products, such as SiC devices in power semiconductors, driver/power supply ICs, and passive components (shunt resistors) in solution circuits under close to

actual application conditions.

MANUFACTURING EQUIPMENT

Pump controller

The 7197PCP-DIN-NX controller for 797PCP progressive cavity pumps provides Ethernet connection with Transmission Control Protocol/Internet Protocol (TCP/IP) for smart factory and Industry 4.0 manufacturing integration. It allows operators

to control all volumetric dispensing parameters directly from a programmable logic controller or other manufacturing plant controllers. This saves time by allowing the operator to program multiple fluid-dispensing controllers from a centralised location and change dispensing parameters on the fly at any point.

Wi-Fi based engraving machine

The MNSB is the world's first Wi-Fi based cordless handheld engraving machine. It weighs only 2.5kg and has a power-packed battery of 5 amperes/hour. Users can achieve more than 3 hours of continuous

marking and around 8 hours of normal marking. It has seamless connectivity with any Wi-Fi enabled device, allowing users to connect their own mobile to the machine and create a design with the product's mobile app.
