

IoT STARTUPS: How CRUCIAL Is This DECADE?

In the coming decade, IoT will be used extensively across the industries over the years to come. With increasing demand, the startups, which are the arteries of the ecosystem, have to cater to the demands of Industry 4.0 and deliver effective solutions that can last for years. This article discusses some of the important ingredients for a startup to be successful in the IoT sector

Smart Assets at
JioThings

In last decade, one of the significant technological advancements that the electronics sector witnessed was the adoption of IoT by industries and enterprises. IoT is expected to be adopted across different industries and complement other technologies to make life better.

Startups have an important role to play in this field. Let's have a look at some of the aspects they should consider while developing IoT solutions and products for industries of the next generation.

Beyond labs

IoT aims to help industries and many other environments in achieving high

productivity, efficiency, safe working environment, and low carbon emissions. These IoT solutions are usually developed through research and development at lab scale. After that, rigorous testing is done to validate if these can survive the environment in field.

Unfortunately, majority of the IoT solutions do not succeed beyond laboratories and so do not reach the market. This is because there are a lot of issues related to interoperability. In an IoT system, there are various proprietary technologies communicating with each other to take care of connectivity, security, and regulations. And the developers have to
