

BUILDING AN IoT STARTUP For Self-Reliant India

The IoT market has seen a burgeoning growth in the past couple of years, with estimates suggesting what could be a \$20 billion market by 2024. Naturally, a lot of budding entrepreneurs are looking at the IoT market with great expectations. But what are the challenges that IoT startups would face in a self-reliant India?

Once viewed as a technology of the future, the Internet of Things (IoT) has become synonymous with everything smart. Across the globe, smart devices are already directly or indirectly dependent on IoT.

The Indian government aims to reduce imports and turn the country into a manufacturing hub. This has created innumerable opportunities for startups to fill the gaps and make the country self-reliant. But the task is not so simple and would need lot more effort than one would assume.

Opportunities

While smart appliances are lucrative, their field has become saturated with

many players venturing in that direction. Yet, the segment provides enough room for innovation given how consumer needs and demands are changing in the wake of the pandemic. With the government's zeal to drive the 100 smart cities project, the number of areas to tap for IoT startups is quite good.

Sanjeev Keskar of Arvind Consultancy says, "The opportunities in the IoT field are huge right now as everything is becoming smart and connected. Be it smart parking, lighting, or signalling—the opportunities to aid the government's vision of a connected India is innumerable." Under this purview of the government's vision, the target of installing 250 million meters by 2022 and the demand
