

# AN LED GLOBE THAT BLINKS When ISS Passes Overhead

ARPAN MONDAL

If you are a space enthusiast and like to look at the stars, chances are you are already familiar with the ISS. The ISS, or International Space Station, revolves around the earth six times each day. If you are interested in the ISS, like the author who is an aerospace engineering student, you will love this project.

This easy-to-make device is a small hemispherical lamp that gives

Fig. 1: Author's prototype

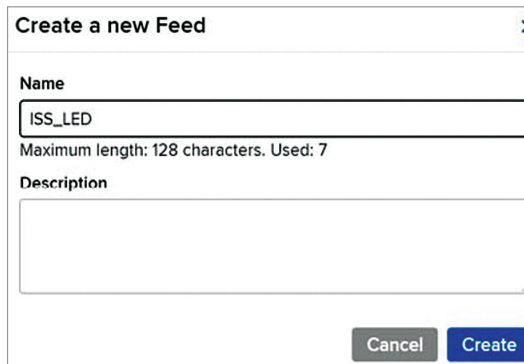

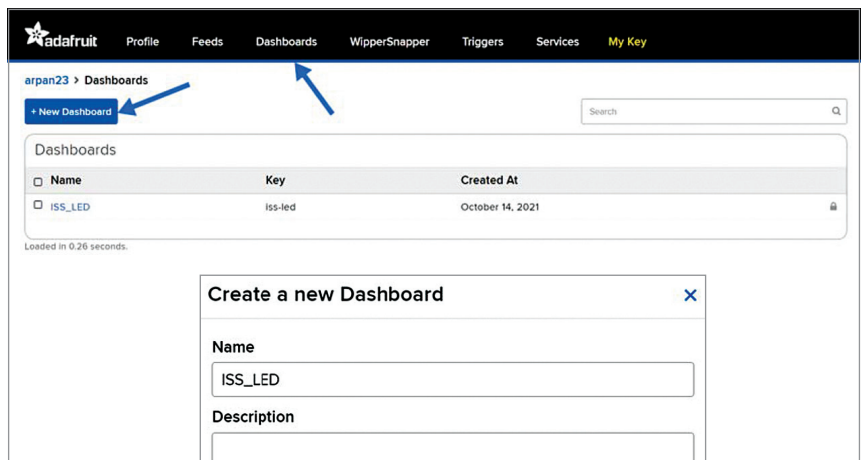

Fig. 3: Step 2 to create a feed on Adafruit

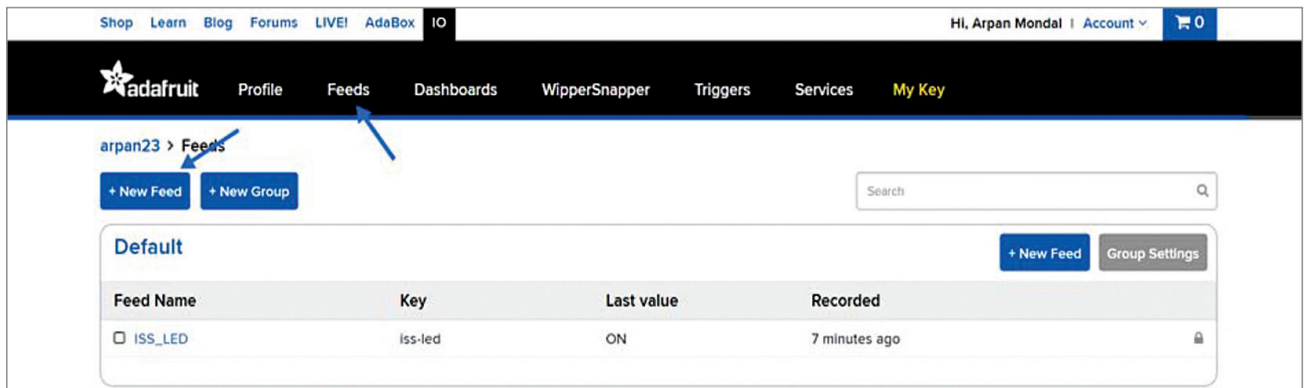

a mild glow when connected to a power supply. But when the ISS passes over its location, the lamp starts blinking for about 30 seconds to a few minutes. The author's prototype is shown in Fig. 1.

All you need to make this project is a node microcontroller (nodeMCU), a 5mm LED, a bit of wire, thick cardboard to make

| Name    | Key     | Created At       |
|---------|---------|------------------|
| ISS_LED | iss-led | October 14, 2021 |
