

How Digital Tools Are Changing EV MANUFACTURE IN INDIA

Electric vehicles (EVs), Industry 4.0, and AI/ML are some of the buzzwords that we hear quite frequently today. With more and more industries leveraging new-age technologies like the Internet of Things (IoT) and artificial intelligence (AI), it is only fair that the automotive industry should also hop on the ride. Amalgamating these buzzwords to bring out semblance in the EV manufacturing process is becoming a key driver for the growth of the EV industry

SIDDHA DHAR

EVs are being talked about more and more in the context of mobility, energy, and connectivity where every aspect is complementing the other. There is more chatter around Industry 4.0, where all technologies are getting integrated in a way that it becomes a whole ‘energy universe’ and automobiles are a part of that universe. EV is not just a transportation device anymore; it is a part of the whole energy ecosystem.

As such, leveraging digital technology to add value to the EV production processes is the obvious choice for any OEM. There is an

opportunity for most citizens of the world to become prosumers and actively participate in the transition to cleaner energy for mobility and electricity.

“I think digitalisation is something that we are going to see more and more, right from the product development to product approval, manufacturing and then managing the customer, or forward linkage when the product goes to the market. So, my opinion is that there is a huge scope of using various technologies like simulation, data analytics, and AI/ML, and bringing
