ABB Robotics has created the world's first robot-painted art car in collaboration with world-renowned artists: Advait Kolarkar, an eight-year-old Indian child prodigy, and Illusorr, a Dubai based digital design group. Without the need for human intervention, ABB's award-winning PixelPaint technology has perfectly recreated Advait's whirling monochromatic design as well as Illusorr's tri-colour geometrical patterns. PixelPaint technology captures complex, elaborate detail that would be hard to produce by hand with extraordinary precision and speed. The paint can be applied in a single application if it is well regulated. This breakthrough in paint automation allows the car industry to offer more specific and individualised designs.

Vibration based neckband for cervical spondylosis

A team from Anant National University, led by Assistant Professor Parth Atulkumar Shah, worked on developing a neck band that focuses on addressing issues of muscle stiffness and nerve compression. The neck band consists of electromagnetic vibrator motors whose intensity of vibration can be controlled using a voltage regulator. These vibrators are placed at the accurate pressure points on the neck such that they stimulate those pressure points. They further increase the blood flow through the veins and help the neck area get more oxygen from blood. The team has also designed an app, known as Pysiocare, using which the users can connect to local doctors and find the solutions to problems related to muscle pain.
