

Leaders' Speak

"The benefits of establishing this industry includes greater than \$11 billion dollars domestic value creation, display export opportunities of up to \$10 billion, and domestic employment generation of more than 200,000," says **Sanjay Agarwal, President of ELCINA and MD of Globe Capacitors.**

"When everything was still being planned and not yet announced, I asked a leading industry expert what kind of incentives they would like, and he said, 'If the government can put up 50 cents for every dollar spent, that would be great'. But today, when we came out with the policy, we gave them one dollar for each of their dollar," says **President, VLSI Society of India and CEO, EPIC Foundation.**

"For the first time the Ministry of Electronics, under the leadership of Ashwini Vaishnav and Rajeev Chandrasejhar, has truly engaged with the industry to recognise the challenges and mitigate them through various reforms," shares **Amrit Manwani, MD, Sahasra Electronics.**

"In light of the semiconductor shortage, it is the perfect time for India to take off and with all the government initiatives and the experience we have created. I think we should invest both in IPs and products. The government has done its part. Now it's up to the MNCs, the academics, the people in the software ecosystem to make it a grand

success," says **Sambit Sahu, VP Network and Edge Products, GM IOTG, Intel Corp.**

"I think that we are sitting on a huge opportunity as far as India is concerned. What I would like to see on a personal level is that a lot of product innovation needs to happen in India. End product

into play," says **Pranav Komerwar, CEO Electronics Display & Semiconductors, Vedanta Limited.**

The group already has a presence in EMS and PCB assembly verticals of the electronics ecosystem. It is of the view that OSATs and semicon fabs can bring in good value addition. "Out of about \$20 billion investment, Vedanta will be making \$8 to \$10 billion in the OSATs and semicon fabs segment. We want to work under Make in India and put products in the world under our domain," says Pranav.

Reliance Industries Limited has already started work on construct-

innovation and end device development needs to happen in India too," says **Balajee S., MD, Samsung Semiconductor India R&D Centre.**

"It actually is natural for suppliers and partners to set up shop near their clients as the same makes business decisions easy. The technical term used by the industry players in the electronics ecosystem is 'Co-design' and Co-development'. Once the display set up is set in India, a lot of co-developers and builders working in

the semiconductor as well as the display ecosystem will be encouraged to expand in India," says **Sudhir N. Pilai, MD, Corning Incorporated.**

"Money going into these initiatives is hearty as the returns will take much longer time. But then it is a very stable business over the long term. You can also grow very rapidly. I have myself worked for companies which were a manufacturing start-up and they became a multi-billion dollar business over time," says **Raja Manickam, CEO, Tata OSAT.**

"Korea, Japan, Taiwan, and China have different systems. The Korean government and the Chinese government support big companies and these big companies support small companies in turn. The governments in Japan and Taiwan usually support small companies and these small companies in turn support big companies," says **Sung Huk Lee, CEO, Tnvision.**

"Whether you look at TSMC, or any other such company, the academia has played a very important role in their success. The key for companies will be to find out how they can collaborate with academia and fine tune relationship building," shares **Sudheer Kumar, COO, NCFlexE, IIT Kanpur.**

ing the Dhirubhai Ambani Green Energy Giga Complex. Located in Jamnagar, Gujarat, the complex will house not one but four gigafactories. These would include an integrated solar photovoltaic module factory, an energy storage battery factory, an electrolyser factory, and a fuel-cell factory for converting hydrogen into motive and stationary power.

"The confidence behind that (India's share in global electronics manufacturing) is because of the interest global champion companies have shown to participate in our PLIs for mobile, where Apple and Samsung as two big players have

ing but Vedanta Group announcing an investment of 600 billion rupees for chip and display manufacturing is the cherry on the cake.

"We want to enter into integrated fabs, both in semiconductor as well as display. We plan to set up internationally competitive facilities. Initially there will be support from the government, but we will achieve leadership in due course of time. Apart from capturing the domestic market, we are also going to focus on export plans. We don't just want to achieve fabs, but we want to enable India and Vedanta as Electronic Hubs. That should bring in the entire ecosystem
