

THE DASHBOARD

Semiconductor Shortage Likely to Ease Significantly in H2 2022

Global semiconductor chip shortages are likely to continue easing during the second half of 2022 as demand-supply gaps decrease across most components. Across PCs and laptops, the supply gap for the most important PC components like power management ICs, Wi-Fi and I/O interface IC have narrowed. Inventory levels of 5G-related chipsets including mainstream application processors, power amplifiers, and RF transceivers have increased significantly.

Component	Shortage Level in H1 2021	Shortage Level in H2 2021	Shortage Level in 2022	Price Increase 2022 (YoY)
AP/SoC - Flagship 5G	●	●	●	Up 5-10%
AP/SoC - Mainstream 5G	●			FLAT
AP/SoC - 4G	●	● ●	● ●	Up +10%
RFIC/FEM	●	● ●		Up 5%
Memory - DRAM/MCP	●	●		Down 10-15%
Memory - Flash				Down 10%
CIS - 64MP and above			●	FLAT
CIS - 12 - 48MP	●			Up 0-5%
CIS - 2/5/8MP	● ●	●		Down 0-5%
DDIC/TDDI	● ● ● ●	● ●	● ●	Up 5-10%
PMIC	● ● ● ●	● ● ● ●	● ●	Up 15-20%
Packaging Substrate	●	● ●		Down 0-5%

● Demand>Supply by 10%

● ● Demand>Supply by 10%-20%

● ● ● Demand>Supply by 20%-30%

● ● ● ● Demand>Supply by 30%-40%

1. Sufficient supply with price competition in 2022

2. Improving shortage to balance level in 2022

3. Slightly shortage in certain parts in 2022

4. Remains shortage in 2022

Microcontroller Sales Expected to Reach \$27 Billion by 2026

Microcontroller (MCU) sales boomeranged back with strong growth in the economic recovery during 2021, when the MCU market climbed 23% to a record-high \$19.6 billion. Between 2021 and 2026, total MCU sales are projected to increase by CAGR of 6.7% and reach \$27.2 billion in the final year of the forecast. In the next five years, sales of 32-bit MCUs are expected to grow by a CAGR of 9.4% to hit \$20.0 billion in 2026.
