

World class Industrial Systems from EmbedSense

EmbedSense Solutions manufactures innovative Industrial grade Wireless IIOT sensors and offers engineering solutions that help manufacturing plants transform themselves into smart factories of the future.

By incorporating AI and ML techniques, data from sensors is analyzed at the edge to generate powerful insights that are used to monitor the health of various kinds of machinery. Being pre-emptive and generating actionable predictive maintenance alerts, our solutions help improve bottom lines by reducing downtime, lowering maintenance costs and by keeping track of productivity. Our solutions are flexible and can be hosted on cloud or on-premises as per client's needs.

The sensors from EmbedSense are also available as stand-alone offerings

and come with API's and support a wide range of protocols. This makes them easy to integrate into existing customer platforms as well. These sensors use wireless transmission to enable rapid deployment at lower cost and are ideal for operating assets in hazardous environments or high voltage domains.

EmbedSense Sensors and Systems Offerings:

- a) Vibration, Temperature, Pressure, Flow Rate
- b) Air Quality, Particulate matter, Gas sensing (Formaldehyde, Carbon Monoxide, Methane, Propane etc.)
- c) Atmospheric pressure, Humidity, Ambient temperature
- d) Electrical Power Quality and Energy monitoring system
- e) Actuator control hardware
- f) Conveyor belt mis-tracking systems
- g) Motion detection and occupancy

sensing

- h) Fluid/melt level measurement
- i) Part counting
- j) Pressure and temperature sensing inside molds/dies
- k) Event counting
- l) VFD/PLC data loggers
- m) Relay boards for AC/DC operation

Rigol Announces New 12 Bit High Definition Oscilloscopes For High Speed Signal Integrity Applications.

Portland, OR - September 15, 2022 - The Best Value in Test just got better with RIGOL Technologies introduction of the HDO Series of High Definition Oscilloscopes. Featuring true 12-bit resolution, HDO oscilloscopes are available in 70MHz - 800MHz bandwidths and 2 or 4 channels. The HDO Series is powered by the new UltraVision III platform featuring

a custom ASIC chipset, which also provides for dramatically lower front-end noise. The higher resolution and lower noise enable users to analyze much smaller signal artifacts with greater speed and accuracy.

HDO4000 oscilloscopes are available in 200-800MHz, 4 channels, 4GSa/sec sampling, 100 μ V/division range, and 250 MPts of memory standard (500 MPts optional). HDO1000 scopes offer 70-200MHz bandwidth, 2 or 4 channels, 1GSa/sec sampling, 500 μ V/division range, and 50 MPts of memory standard (100 MPts optional). Both series feature 12 bit resolution

and a 10.1" intuitive touch screen display. They also incorporate RIGOL's new UltraAcquire Burst Capture mode which makes it possible to visualize dynamic signals in multiple display modes while minimizing down time between trigger events.
