

Platform to simplify software development

To simplify the process of software development in multi-core project workflow, Infineon Technologies has

announced the release of ModusToolbox 3.0. The development platform offers dual-core device support, backend system improvements, a new graphical tool for custom board support package development, and infrastructure support for ModusToolbox Packs. ModusToolbox 3.0 is compatible with a wide Infineon product range, including PSoC 4, PSoC 6, XMC, AROC Wi-Fi, AROC Bluetooth, and EZ-PD PMG1 microcontrollers. The development platform can simplify software development for a wide variety of use cases such as IoT, industrial automation, smart homes, etc.

ENTERPRISE SOLUTION

Railways gateway computer

IBase Technology has announced MPT-500R, a sturdy railways gateway computer capable of powering IP cameras and running artificial intelligence identification. The computer is based on Intel's Atom x6000E processor and is designed to work in harsh operating environments. It comes with various connectivity options and employs rugged connectivity ports for longer operational life. The computer features two PoE ports that can provide power to two IP cameras and run artificial intelligence identification on the go. It features a robust M12 USB, Ethernet, and power input connectors.

Line scan camera

Teledyne DALSA's AxCIS is a high-speed and high-resolution line scan camera in a fully integrated, compact package for demanding machine vision applications. The module incorporates sensors, lenses, and lights—all in one single housing, making it cheaper and faster to deploy the product. With up to 120kHz line rates for mono and 60kHz x 3 for colour imaging, along with a 900dpi resolution, Teledyne's revolutionary quad linear CMOS image sensors enable the module to achieve flaw detection with a high degree of accuracy. This contact image sensor is easy to use and offers a lower system cost for many demanding machine vision applications. The module is suitable for use in general machine vision applications, such as battery inspection, production line inspection, and PCB inspection.

T&M

High-res real-time oscilloscope

Rohde & Schwarz MXO 4 series oscilloscopes bring new advancements to the T&M space. The oscilloscopes feature the world's fastest real-time update rate and employ a 12-bit ADC that offers 16 times the resolution of traditional 8-bit oscilloscopes. These features not only increase the number of samples but offer better memory, faster sampling, and lower measurement noise. This means that an engineer will be able to quickly see and isolate infrequent events, get a better understanding of physical layer signals, and test faster. The oscilloscopes also enable engineers to view and analyse more RF signals than any other oscilloscope

in its class.

EV charging station tester

Fluke's FEV300 with 1664 FC Multi-function Installation Tester is a complete kit designed to test the function and safety of charging stations' Mode 3 for AC charging. The tester allows testing all local regulations without opening the charging station. It can allow the operator to safely verify whether a charging station is working properly during maintenance or inspection of the charger and help ease the process of troubleshooting a charging station if it is not delivering the appropriate charge. The tester allows the output of a Mode 3 AC charger with connector types 1 and 2 to be tested in accordance with IEC/HD 60364-7-722 and IEC/EN 61851-1.

MISCELLANEOUS

Low-temp soldering materials

Nihon Superior's TempSave is a series of low-temperature soldering materials that can improve the strength of solder and reduce cold solder joints. The halogen-free P610 flux medium is specifically designed for Bi alloys. The TempSave B37 P610 solder paste can be reflowed with a peak temperature of 190°C. The high-speed jetting paste version, called TempSave B37 P611, provides consistent dot sizes. Soldering materials that melt at lower temperatures offer multiple advantages, such as a reduction in energy utilisation for melting the solder, reduction in defects contributing to package warpage, and avoiding potential damage to temperature-sensitive devices.
