

ECONOMICAL IoT SENSORS For The Developing World

Technology brings convenience and efficiency in our lives, so it should be made accessible to everyone at the most affordable cost possible. Let us take a look at the progress that has been made in developing the most affordable IoT sensors that there are

PROF. RAMGOPAL

The Internet of Things (IoT) is a network of physical objects called things, which include electronics hardware, software, sensors, power source, and network connectivity that connects these objects to collect and exchange data. The IoT devices need to be self-supporting for their longevity, which is essential for them, but they also need to be low-cost.

The world as a whole is not a very rich place. According to the data from the World Bank Atlas, almost half of the world, or over three billion people, live on less than 2.5 dollars a day, while 80% of humanity lives on less than 10 dollars a day. It is important to keep their requirements in mind while developing new tech as they cannot afford the iPhones and the iPads. We need to develop technologies that are suitable for them as well and can

improve their quality of life.

There is also a need for low-cost IoT platforms due to the issues that are being faced in the following sectors:

Security. For homeland security as well as cyber security.

Healthcare. For web-enabled healthcare initiatives, diagnostics, rural healthcare, etc. Clean water and sanitation issues need to be addressed as well.

Agriculture. 80% of the water gets used for agriculture, so saving water is very crucial. We only have 4% of the world's water resource in India for 18% of the world's population.

Pedagogy. India needs to create a million jobs per month to meet the demand and address their training needs, educational requirements, and skill development.

Environment. Sensor networks are
