

Improve Battery Cell Productivity Through Detect Contamination that Could Cause Defects.

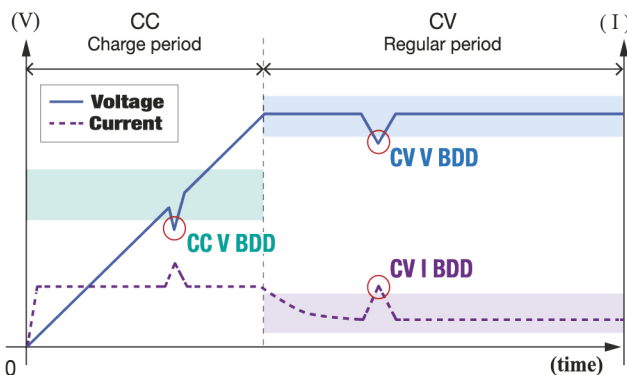

Minuscule Insulation Defects Can Eventually Degrade Battery Service Life
Maximum Test Voltage is 500 V.

High-speed testing to increase production volume.

The BDD function helps prevent the risk of hazards such as fires and accidents caused by heating after battery shipment.

Judgment methods

CC V	Insulation defects are detected using the voltage value (V) during charging. Judgments are made using the voltage value immediately prior to the change. Setting range: 0.1 V to 500.0 V
CV V	Insulation defects are detected using the steady-state voltage value (V) after charging. Judgments are made using the steady-state voltage (voltage after stabilization). Setting range: 0.1 V to 500.0 V
CV I	Insulation defects are detected using the amount of change (%) in the steady-state current after charging. Judgments are made using the current value immediately prior to the change. Setting range: 0.1% to 999.9%

Key Features

- ⦿ Shorten cycle times
- ⦿ Desired Specifications
- ⦿ Compact Footprint
- ⦿ Waveform analysis using the PC application

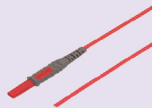

Option

CLIP TYPE LEAD L2130
For HIGH terminal, banana/alligator clip, red, cord length 1.5

CLIP TYPE LEAD L2131
For LOW terminal, Hioki Special Connector /alligator clip, black, cord length 1.5 m

UNTERMINATED LEAD L2132
For HIGH terminal, banana/cut wire, red, cord length 5 m

UNTERMINATED LEAD L2133
For LOW terminal, Hioki Special Connector cut wire, black, cord length 5 m

OUTPUT CORD L9094
For analog output, banana plugs (red, black), cord length 1.5 m

RS-232C CABLE L9637
For external control, double shielding, 9-pin/9-pin, cord length 3 m
