

The Significance Of EU's NEW MACHINERY DIRECTIVE For Industry

According to the European Agency for Safety and Health at Work, the new machinery Directive 2006/42/EC “aims at the free market circulation on machinery and at the protection of workers and consumers using such machinery. It defines essential health and safety requirements of general application, supplemented by a number of more specific requirements for certain categories of machinery.”

MAHESH DAVE is Technical Director at Trio Technologies and CEO at TuBro Innovative Compliance Solutions LLP. He has global experience of 27 years working at key positions of various Notified Bodies on International Approvals & Global Compliance Requirements

Due to increasing use of technology in the development of robots and other manufacturing machinery, there is a significant change in their production processes and the introduction of safe practices is being emphasised. As a result, the machines manufacturers are being encouraged to introduce new technologies, robotic processes, and the use of digital technology with care to safety.

The technological metamorphosis and digitalisation are forcing European mechanical engineering producers to slow down to maintain competitiveness in the global arena. Among the

new outstanding technologies in use are advanced production (for example, IoT scales and 3D printers) and advanced resources (including nanomaterials), which is an important step in establishing Assiduity 4.0 or Smart Industry.

In particular, IoT is developing rapidly and steadily. Its use is set to increase in the design and integration of manufacturing facilities and the production of clothing and machinery. Some domestic and foreign companies in the manufacturing sector count on IoT to control and regulate their facilities, increase the transparency of their service (by monitoring integrated performance and so-
