and settings or rules may not be changed to exceed the limits specified by the manufacturer in the initial risk assessment. Also, in the learning phase, machine behaviour should be limited by appropriate safety circuits.

In addition, in the context of the Essential Health and Safety Requirements (EHSR) operating on mobile devices, specific indicators have been included in autonomous mobile devices and, in particular, automotive vehicles.

Among the various AI-related amendments made during the Mechanical Control Act process, the following four proposed changes are particularly prominent:

1. Changing the reference of machine products that introduces 'high risks' to 'potential risks,' while AI Act provides that AI systems are considered 'high risk' if certain conditions are met or arise from a specific list attached to the Regulations.

2. Adoption of actions submitted by the Commission for the Amendment of Annexure I within 36 months of its commencement.

3. The use of Mechanical Control is limited to AI systems that are self-contained and can occur during normal operation, thus excluding stationary/decryption systems with programmed code to perform certain automated operations.

4. Draw up appropriate guidelines that consider the development of AI and equipment to properly assess the additional risks that may arise during the life cycle of a machine.

Cybersecurity and system corruption

Among the new threats, the Regulatory Regulation is turning its attention to cyber-attacks and malicious software, controlling cases of accidental accidents, and instances in which equipment security may be

compromised by a deliberate external attack. Keeping this in mind, manufacturers will need to take appropriate steps to ensure that the control circuits performing the security functions are designed to prevent malicious attacks on the system.

With regard to the protection of computer systems from system damage, it is provided that the machine is designed and built so that its contact with something does not cause a dangerous situation. And computer components associated with machine connectivity and/or software access, which are important from a security standpoint, should be adequately protected from potential damage or intent.

The proposal is in line with EU cybersecurity policy and links cybersecurity systems under Regulation (EU) 2019/881 to demonstrate compliance with the Mechanical Law. In particular, certificates or declarations of compliance under the cyberse-
