

DIGITALISATION: A Sea Of Endless Opportunities

A semiconductor sits at the heart of any electronic device. Over the last few years this industry has witnessed a boom that is revolutionary in many ways due to the digitalisation of various electronics prospects along with the advancements that one could not have expected a decade ago. Read on to learn more about the same

JOE SAWICKI is Executive Vice President at Siemens Digital Industries Software

Digitalisation is the representation of the fundamental changes in the business landscape. It includes the aspects of putting increasingly smart systems in place, which are capable of being reconfigured on the fly and delivering new and unprecedented user experience, and how companies are digitalising their whole business operations.

Increasingly, companies are moving more of their business fabric onto a semiconductor framework, which is enabling them to move from an on-site premise work environment to distribute the work around the globe. If you go look out in the market today, you will see some of the following trends settling in.

Increasing semiconductors content

We can see in the chart in Fig. 1 that the semiconductors content in electronics

is increasing steadily. Historically, during the mid-90's this growth was at a fairly constant level of about 16% of the overall electronics. Considering the rate at which we are putting out new smart systems with greater abilities, by the year 2026 about 25% of those machines will drive off semiconductors, hence paving opportunities for the companies involved in this space.

Companies becoming SoC designers and manufacturers

Increasingly the systems houses are becoming IC design companies as well. This trend has been witnessed in the smart-phone space, whether it is Apple, Google, or others. Companies working in this space have increasingly started designing their own ICs. Even in communication and automotive sectors the original equipment manufacturers are increasingly becoming designers rather than mere consumers of semiconductors.
