

concern for privacy amid hi-tech applications, like face-recognition in surveillance systems, Shah says, “I’m sure that the lawmakers are going to be cognizant of the fact that we can’t be naive and open ourselves to all the fragility that comes along with the ban on such kind of data. At the same time, if you want to protect your citizens, you can always set a time limit for its storage.”

The thought process behind naming the startup went like this: Optimized because they “provide solutions which are neither expensive nor below the level of international quality;” Electrotech because they are “eventually a technology products company, purely based on electronics.”

The company is aiming for a larger manufacturing/assembly facility in either Gujarat or Karnataka. The startup’s biggest milestone

Co-founders of Optimized Electrotech (left to right): Anil Yekkala, Dharin Shah, Kuldeep Saxena, and Sandeep Shah

would be to make a single module compatible with the acquisition and processing of images from space, vehicles, and naval ships on a simple civilian-type camera. “If a single module can do all of that, I think we would have achieved our own vi-

sion, the vision of being ubiquitous, the vision of being at all the places by virtue of our values, without at all being dependent on other countries,” concludes Shah, with a sparkle in his eyes.

## 2 **DEVICE TO CHECK** UNDERNUTRITION AT SCHOOLS

It is necessary to have a healthy nutritious diet for the proper growth and development of children. UdyogYantra has developed an AI device for real-time child nutrition and growth tracking

**O**ver 149.2 million children globally are suffering from undernutrition. And many of them fall in the severely malnourished category. Malnutrition affects a child’s health and results in low body weight, prominent bones, muscular dysfunction, and altered immunity.

Despite the Central and state governments implementing the PM POSHAN programme in government schools to provide proper nutrition to children during school hours, they are given low-quality

and insufficient food due to lack of proper monitoring. To overcome this problem, UdyogYantra, a deep-tech startup in Delhi, has invented and patented an IoT-AI device, named NutreGRO. It tracks
