

UdyogYantra's NutreGro scanning school meals for food security and equality

the food quality and nutrition being provided to children and its impact on child growth.

“Our NutreGro device helps the school to capture and maintain a digital nutrition report card and health record of each child. We enable 100% traceability of every meal given to the individual student. Using NutreGro device, the children with malnutrition, underweight, and growth abnormalities can be well detected in advance,” claims Ankur Jain, Founder and CEO, UdyogYantra.

NutreGro device has an Intel processor and includes 120GB SSD, 4GB DDR4 RAM operating at 2400MHz, 39.6cm viewable display, wireless mouse, and keyboard. The device can accurately monitor food weighing 10gm to 10kg. It monitors

a child's height and weight with more than 90% accuracy in an environment with temperature ranging from 5°C to 40°C. It detects food temperature from -10°C to 105°C.

NutreGro facilitates real-time monitoring of mid-day meals at schools and assists in detecting malnutrition scenarios. The AI in this IoT device identifies the food contents and their nutritional value. Its AI facial recognition identifies the children and provides their weight, height, and BMI in real time.

NutreGro technology is already deployed in schools in Andhra Pradesh, Maharashtra, Karnataka, and Haryana, where every child comes with her/his meal and the device captures the food content like hot pongal, sambar, egg, chikki, etc. NutreGro allows live inspection and

audit of meal quality and quantity, and creates a nutrition report card for each child.

UdyogYantra's current strategy is to go business-to-business (B2B) first and then gradually get to the consumer-facing deliverables. Hence, so far they have introduced products that can be implemented in schools and factories. Talking about their achievements, Ankur Jain says, “We have crossed 50 lakh (5 million) rupees in revenue within a year of launching the technology commercially. We were among the top ten IoT startups in the country at the National Startup 2020 event. Intel has also recognised us as the only market-ready solution from Asia, which is a global solution.”

3 SWAPPABLE BATTERIES FOR ELECTRIC 2-WHEELERS

The world is switching to green mobility, but improvement in the energy storage technology and charging infrastructure is essential for increasing the rate of adoption of electric vehicles (EVs). Renon is an energy storage company in Surat with an R&D office in Bengaluru. The company started in the year 2019 with the aim to reduce carbon emissions and contribute to the greenification of energy. They design and develop Li-ion battery packs for mobility, energy storage, and stationary applications. Renon's latest product, Groot, is a swappable smart battery pack for low-medium speed electric 2-wheelers
