

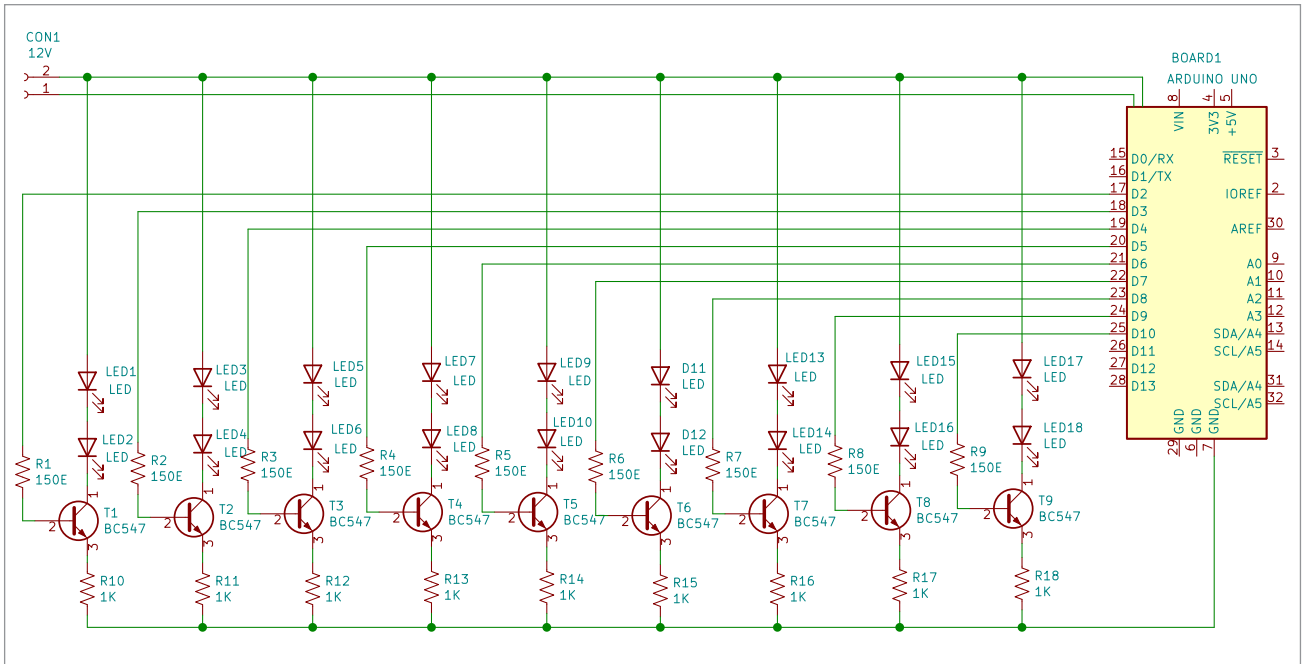

Fig. 3: Circuit diagram for 18 LEDs

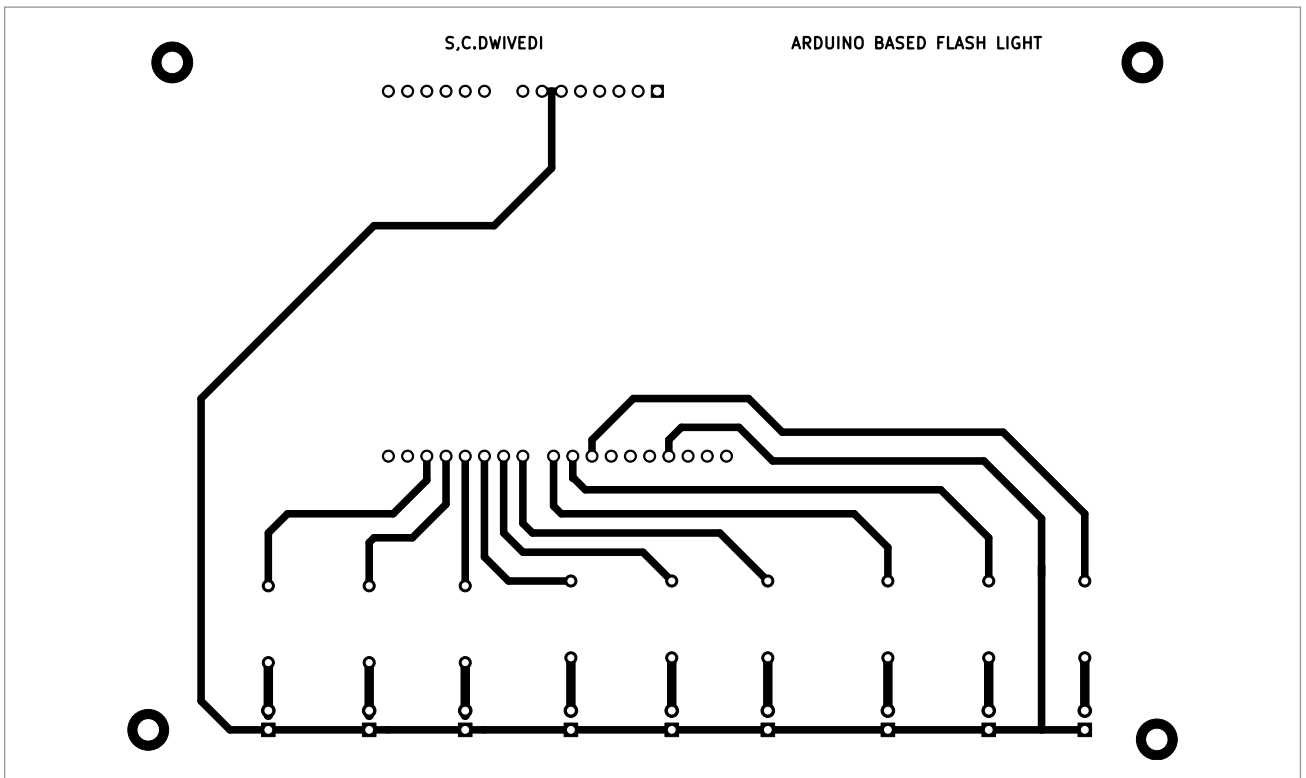

Fig. 4: Actual-size PCB layout for the circuit in Fig. 2

When nine LEDs are connected to the Arduino board, these are listed as array “led array [] = {2,

3, 4, 5, 6, 7, 8, 9, 10}”. The “for” loop in program shifts the state of the pins listed in the array with the

increment of the variable “i”. Thus, it switches each pin in the array to a high state and low state with a delay
