Multi-protocol IoT antennas

MAX antennas from RangeAnt is a newly launched series of multi-protocol high-efficiency antennas, which enables companies to build products for global markets while simplifying their design effort and inventory by using only one type of antennas. The antennas have a working range of 700MHz to 3000MHz and are suitable for use in cellular GNSS applications. These can be used with multiple protocols, including Bluetooth, Zigbee, Sub-GHz, LPWAN, Wi-Fi, and cellular. The antennas are up to 90% efficient, making them suitable for use in low-power IoT applications.

Si IGBTs for EV inverters

Renesas Electronics Corporation's new AE5 generation of Si IGBTs is designed for EV inverters. The AE5 IGBTs have

a smaller footprint and higher efficiency, making them suitable for

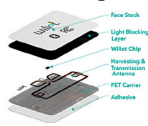

space-constrained power-intensive applications. These IGBTs have lower levels of parameter variations between components, which improves the performance and offers a high level of safety while providing stability when operating multiple IGBTs in a parallel configuration. The IGBTs come in four

models capable of withstanding 220A and 300A at 750V, and 150A and 200A at 1200V. The AE5 offers a 50% reduction in the temperature dependence of gate resistance (R_g), thus minimising switching losses at high temperatures, spike voltage at low temperatures, and short circuit withstand time, thus supporting high-performance designs.

Batteryless stamp-size device

IoT Pixel is a batteryless stamp-size computer from Wiliot. The ultra-efficient postage stamp-size device can

harvest radio waves and work without a battery for years.

The device has been specifically made for the supply-chain industry. As it requires no battery to operate, it increases the ease of use and simplicity of deployment. The stamp-size device comes in a small package measuring just 2.8cm × 4.4cm × 0.2mm, so it can easily be attached to items using a regular label applicator. The IoT Pixel can help in creating a circular economy, reduce waste, and improve the efficiency of the supply-chain.

Miniature coaxial reed relays

Series 113RF from Pickering Electronics is a new miniature coaxial reed relay for high-frequency RF systems. These reed relays are suitable for switching up to 10W, 0.5A. These are smaller and much faster than the electromechanical relays. Moreover, these relays offer lower insertion loss and better hot

switching performance than the micro-electromechanical (MEM) relays, making them more suitable for designing compact modules. Series 113RF relays are developed for use in high-frequency RF systems up to 3GHz, making them suitable for applications such as automatic test equipment and digital switching systems that demand low RF losses and low insertion loss.

Dual-band Wi-Fi companion IC

Nordic Semiconductor's nRF7002 is an ultra-low-power, dual-band Wi-Fi 6 companion IC capable of providing seamless wireless connectivity. The IC can enable Wi-Fi based locationing by using SSID sniffing of local Wi-Fi hubs. It can enhance the runtime of low-powered IoT solutions and offer both 2.4GHz and 5GHz dual-band. Moreover, it complies with 802.11a/b/g/n/ac/ax. The companion IC is suitable for use in IoT applications and brings added benefits to the applications, including further efficiency gains that support long-life, battery-powered Wi-Fi operation.

Digital automotive temperature sensor

STS4xA series of digital automotive temperature sensors from Sensirion come in DFN package. The series currently offers two versions: STS41A-AD1B and STS41A-AW1B. Both feature an on-chip heater that enables the on-board diagnostics and offer functionality and
