

explain what a GPU is in the 1980s and 1990s. It would be difficult. So, a foundational technology company like us always faces this issue. That's why we are a long-term game.

What kind of partnership opportunities are there for like-minded firms to partner with CynLr?

Nikhil: We are absolutely open to partnerships. We, being a technology company, are going to depend on a fairly broad network of partners, who would either be custom system engineering companies or productised companies like Ace Micromatic Group. Also, the last mile delivery is going to be done by system integrators. Overall, there are two types of partnerships here—technology partnerships and application partnerships.

Gokul: Any technology can be made usefulness only through an application. So, we are open to all application partnerships. Our tech can be applied to part tending, part assembly, and part inspection from an application perspective. On the other hand, there are technology partnerships that help us enhance our features. For instance, we could partner with vision manufacturers, camera manufacturers, robotic arm manufacturers, or even augmentation systems.

What are your general hiring trends?

Gokul: We have grown from an 8-member team to a 20-member team in this last quarter. By the end of this year, we will have a 50-member team. So, we're actively recruiting for a wide variety of roles. There is a fair split between the engineering roles and the non-engineering roles. As we speak, we are gearing to visit top engineering colleges in the country to recruit for fresher roles.

We hire freshers as well as experienced professionals. Simply put,

there are two kinds of problems—unexplored problems and unsolved problems. Unexplored problems are easier to solve, for which you can actually get industry best practice experts. Unsolved problems are where people have a lot of opinions. So, it's harder to make them unlearn and then relearn, which is why we hire people who have a fresh perspective about things. When it comes to certain platforms, tools, and technologies, we try to bring in experts.

Nikhil: On the engineering side, being in the robotics and vision space, there's a very broad spectrum of roles. We have all the disciplines coming together. So, we hire electronics engineers, mechanical engineers, software engineers, instrumentation engineers, and people with a science background.

Some of our engineers are currently working on neuroscience and neuroscience research, trying to validate our algorithms with how human vision works. If you see the books that are there in our library, you will see a wide gamut of books, even medical books, or legal books!

What's next for CynLr?

Nikhil: As a part of this commercialisation plan, we have a goal to establish our presence in at least one country along with India. We'll be looking to work in the US, Germany, and western Europe in the future. In India, we are expanding our headquarters in Bengaluru and moving to a much larger space. We also aim to have an Experience Centre for customers to come and experience what the future of manufacturing is going to look like.

Gokul: We're also looking for domain expansion. Right now, predominantly, our customers are from the automotive sector. In the future, we also want to expand into the electronic assembly market—especially mobile and gadget manufacturing, and even logistics. **EFY**

Share Your Knowledge

If you are an expert in your field of electronics, why not share your knowledge with the world?

Electronics For You invites electronics professionals and industry experts to write articles on their area of expertise and interest from different perspectives

Some of the topics we want you to write about are:

- Smart World
- Artificial Intelligence
- Autonomous Cars
- Bio-Medical (Healthcare)
- Strategic (Defence) Electronics
- Audio-Video
- Project Reports

So if you have an interesting topic or original article to share, please let us know at efyeditorial@efyindia.com

We would love to hear your good ideas too!
