

India's No.1 Electronics Magazine
RANKING AS PER ELCINA-IMRB REPORT

EFY GROUP
YOURS SINCE 1969

Facing problems in getting EFY Magazine in your area?

If so, let us know!

Electronics For You magazine is available at all top news-stands/outlets in India. But if you are facing problem in getting EFY magazine in your area, please call Akhilesh Yadav on **+91-8800295612** or drop an email at efycirc@efy.in. We will help you locate the nearest news-stand or arrange a copy at your doorstep.

South Asia's Most Popular Electronics Magazine

Those who wish to distribute EFY Group publications may also call Akhilesh Yadav on +91-8800295612 or write at efycirc@efy.in

tor industry. At the same time, there is a visible shift away from STEM (science, technology, engineering, and mathematics) focus in the new global generation.

The Indian talent can fill the global workforce gap in high-value manufacturing as well as design with strategic focus, right relationships and planning.

At Electronics Sector Skills Council of India (ESSCI), we are reviewing a stackable skill programme that builds on the foundational degrees in mechanical, electrical, electronics, and materials/chemical engineering. By coupling it with global branded programmes from SEMI (an industry association comprising companies involved in the electronics design and manufacturing supply chain) and leveraging our own academic pool, it is possible to create a strong Indian semiconductor skilled force that can serve the Indian as well as the global demand.

ESSCI is working with industry associations and the government of India's Ministry for Electronics and Information Technology (MeitY) to build a framework of talent management pipeline and skills—not just for design but for semiconductor manufacturing as well.

3. The semiconductors demand is fundamentally very strong and likely to remain so over this decade. It took the last several decades for the industry to touch \$500 billion sales, but it is projected that this figure will double by end 2030 to \$1 trillion.

This will be driven by the explosion of data, the Internet of Things, new downstream consuming sectors like the auto sector, life-sciences, and more. Hopefully, India Semiconductor Mission will define its target niches and select a strategic path with viable combinations of sustainable geometries, integration strategies, and go-to-market programmes.

What are these target niches? Essentially, these will likely be select chip-sets that will be relevant to

our health security (life science), fintech, and select strategic sector chips.

Going forward, the semiconductor industry is going to see proliferation of products across different node geometries, advanced semiconductor packaging, leveraged heterogeneous integration combining dies with different materials, different functionalities, and even from different fab origins in a SiP (System-in-Package). As terminologies dominate technologies, there will be ample opportunity for India to work with trusted relationships in the USA to build its own semiconductor sectors.

4. The USA is traditionally a high-cost economy. While it will likely capture the higher-value segments in the semiconductor manufacturing, the USA will seek cost-efficient supply-chains, trusted manufacturing partnerships, and skilled manpower for its manufacturing program.

India has evolved from the early 21st century. The new India landscape is increasingly innovation-intensive and we have a proven track record as a software contract engineering services centre. We have a major opportunity to leverage our position in the value-chain and evolve as a trusted, cost-effective contract innovation (R&D and Engineering) partner.

The US CHIPS Act underscores the need for building trusted relationships to enable India in the new, emerging semiconductor landscape. The US and the global industry will need an agile workforce and efficient as well as cost-effective supply-chains as alternatives to the existing options.

India needs to move fast to capture the opportunity that this new world order in semiconductors is creating. In the end, strategy combined with strategic relationships and execution will be the key to success. **EFY**
