

Fig. 12: Light in off state before the command

Construction and testing

Next step is to interface the NodeMCU with Amazon Alexa Eco. Start discovering the devices by saying “Alexa discover devices.” The discovered devices will get displayed in the app, as shown in Fig. 9. Please ensure that the Wi-Fi SSID and password for NodeMCU and Wi-Fi to which Alexa is connected are the same.

Now, we can send commands to Amazon Echo. Alexa will respond to the following commands:

“Alexa, turn on light 1”
 “Alexa, turn off light 1”
 “Alexa, turn on light 2”
 “Alexa, turn on light 2”

Fig. 13: Light in on state after the command

“Alexa, turn on light 3”

“Alexa, turn off light 3”

“Alexa, turn on fan”

“Alexa, turn off fan”

When you say “Alexa, turn on light 1,” the esp8266 will trigger a relay to turn on light 1. When you say “Alexa, turn off light 1,” the esp8266 will send a signal to the relay to turn off light 1, as shown in Fig. 10. This works similarly for light 2, light 3, and the fan.

Fig. 11 shows how to give command to Echo Dot, Fig. 12 and Fig. 13 show the light’s status (off and on) before and after giving the commands to Alexa. **EFY**

N.M. Sai Krishna (top left), Assistant Professor at BVRIT Hyderabad College of Engineering for Women, is an IoT and Embedded Systems enthusiast. R. Priyakanth (top right), Associate Professor at the same college is an IoT, Embedded Systems, and Signal Processing enthusiast. A. Pranava (bottom right) is final year student at the college.

Anyone who stops learning is old, whether at twenty or eighty.
