

Enabling India to Become Global Innovators with our Cutting-edge Technology

The rising demand for digitization in industrial and consumer electronics is driving various innovations in the PCB manufacturing process. The consumer demand for having more smarter, more reliable, and more flexible digital devices have forced us to bring forth new and better technology for their PCBs.

To facilitate this need for good quality, we offer high quality reliable solutions for all electronic devices. We leverage cutting-edge methods and technologies to fabricate PCBs with an absolutely transparent process.

We offer two kinds of PCB Fabrication: Rigid and Flexible. Working in the industry for over 25+ years, we have a high-grade fabrication operations system that entirely focuses on consistency, agility, and innovation. Every PCB manufactured in our

facility ensures design adherence and provides output specific to the client's requirements.

Other than that, we also offer flexible PCB based on custom technical specifications. Flexible PCBs are highly beneficial and can be used in the automotive industry, communications

and medical equipment, aerospace, transportation, military & aviation, etc. Similar to PCB fabrication rigid, flexible PCB fabrications are available in single- and double-sided layers.

Our manufactured PCBs go through rigorous testing procedures to ensure the best output of the product. We are working deterministically to empower innovators and support make in India. Hence, to enable innovators to build new and better electronic devices, we offer flexible ordering with a minimum order quantity of just 1 unit.

XENO+ WiFi+BLE5.0 Nano ML Module

XENO+™ WiFi+BLE Nano ML Module is a solderable module and can be used as core ML (Machine Learning) module of new Battery powered ML edge devices of customers. This XENO+ Nano ML module is suitable for Always-On-Voice (AOV) and AI for IOT application requirements. With XENO+ Nano ML module, the customers can leverage on-board MICs (or) build carrier board to attach external MICs on to I2S/PDM pins (or) I2C sensors onto I2C pins for building their Battery-operated ML devices.

The customers can build their Embedded SW using Application Development Libs (APL) offered along with XENO+ Nano ML module. The customers can leverage FOTA and PKCE based Device authentication features offered with XENO+ Nano ML module. The Customers can save up to 40% of HW and SW development time.

The module has smallest possible size and offers 2 choices of MCU: ARM Cortex-M23 @ 96MHz, 1MB Flash, 256KB SRAM or ARM Cortex-M4 @ 80MHz, 1MB Flash, 128KB/352KB SRAM. The customers can directly use CubeIDE/KEIL IDE via JTAG dongle connected to SWD port for developing their main embedded SW applications with In-System Debug Capabilities on this MCU and thus helps SW developers to debug and fix the field reported SW issues in less time.

This module has Syntiant NDP120 neural decision processor that runs multiple Audio and Sensor ML

applications simultaneously with minimal power consumption. The NDP120 is designed to natively run multiple Deep Neural Networks (DNN) on a variety of architectures, such as CNNs, RNNs and fully connected networks up to 256 layers.

The module uses Innophase's Ultra-low power WiFi b/g/n and BLE5.0 with LR, 2M PHY and Extended Advertising with single antenna for both WiFi and BLE.

The XENO+ Nano ML module can readily be used in following Customer Applications:

- Human Alert Sound Sensor and Voice Commands Detection
- Industrial Machine vibration/ noise Detection, Alarm Events detection
- Pest Sound Detection
