

YOU CAN NOW SET UP AN EFY-CERTIFIED SKILL DEVELOPMENT CENTRE IN YOUR INSTITUTION

In Partnership with EFY

Referred to as ESDC, the Centre will help students improve their hands-on skills, make exciting projects of their own and understand the latest technologies

For more details, please call: Shyam (+91-8800100761)
email: efyenq@efy.in or visit: <https://efymag.com/ESDC>

Skill up for metaverse job openings

According to specialist staffing firm Xpheno, there were around 55,000 job openings related to the metaverse in the beginning of July. These were spread across various skills like artificial intelligence (AI) and machine learning (ML), virtual and augmented reality (VR and AR), gaming, user interface and user experience (UI/UX) designing, blockchain and cryptocurrency, security, and so on.

There are not enough engineers to create this whole new world, so companies are also wooing the soft-skilled, like designers and content writers. Companies like MindTree, for example, are hiring across the ecosystem—designers, 3D artists, blockchain specialists, game developers, voice based cognitive developers, solution architects, integrators, data specialists, AI, Internet of Things (IoT) and geospatial architects, and more.

It is time for developers to fortify their tech skills with an understanding of the evolving dynamics of this new world—right from blockchain and cryptocurrency to privacy and the legalities.

Learn about the metaverse from top universities

The University of Pennsylvania's Wharton School is the first Ivy League business school to launch a certification in the metaverse. 'Business in the Metaverse Economy' is a six-week programme at Wharton developed in collaboration with Prysm Group, a firm specialising in the economics of blockchain, digital assets, and the metaverse.

It will be asynchronous and online, and the first batch starts this month. The curriculum will cover AR and VR, cryptocurrencies, NFTs, blockchain, and more, through lectures, case studies and practical use of the technologies.

The University of Tokyo has also said that it will launch a series of courses later this year to cover the fundamentals of metaverse technologies. The courses will be set up by the university's faculty and will address a wide audience ranging from high school students to working professionals.

It will enable students to explore new career paths opened by the metaverse and provide an opportunity for professionals to reskill themselves to handle digital transformation. The courses will combine online and offline classes with practical learning. Certificates will be issued on completion of the courses. **EFY**
