

Whither To Wearables Industry

Wearable devices, though popular among the young, are not being used so much by the older generations. Of those who are using, most seem to be doing so to control obesity and to keep a tab on the exercise they do. However, wearable devices can do a lot more, the discovery of which is likely to make them much more popular in coming years

With technology progressing day by day, wearables are becoming an essential part of our lives. The modern sophisticated devices are equipped with smart sensors and are capable of using the Internet for exchange of data. Emerging as a lifestyle, the devices are being made for wearing on various parts of our body. Some examples are, smartwatches, head-mounted displays, smart clothing, ear-phones, body-worn fitness trackers, cameras, exo-skeletons, and medical devices.

A wearable medical or healthcare device is used for tracking a user's vital signs or data related to health and fitness. As we move towards an even more technology-oriented world and improved connectivity, these devices are expected to be ubiquitous. Though these devices are gaining popularity globally with certain segments of the population, such as the fitness-oriented consumer, the market within India is still at a nascent stage.
