

Bad Users Can Fail A Good AI System

A good artificial intelligence (AI) solution in the hands of bad users can be disastrous, while an average AI solution in the hands of good users can be a great success. Hence, it's important to educate the users to extract maximum positive value out of it

If users or other interacting systems are not good enough, then no matter how intelligent your artificial intelligence (AI) system is, it will eventually fail to deliver. The failure may not be the only outcome, but in some cases, it may also result in business risks.

AI systems are not standalone as these often interact with several other systems and humans, too. So, at each interaction point, there is either a chance of failure or degraded performance.

There are a variety of users

We can classify computer users by their roles or expertise levels. In case of role-based classifications, they look like administrators, standard users, or guests. Whereas, skill-based groupings put them in categories such as a dummy, general user, power user, geek, or hacker.
