

Technologies Reforming Education And Skill Development

With the availability of new technologies such as robotics, cloud computing, artificial intelligence (AI), and machine learning (ML), there has been tremendous growth in the education and skill development sector. These new technologies help in collecting data related to several parameters such as the academic performance of students, skills of teachers, and the like

A few decades ago people had to search for information in libraries and other such places containing books and records. Today, due to the availability of the Internet, we can use search engines and assistants to get any information we want

without going anywhere. Chalks and blackboards have been replaced by styluses and smartboards in most urban centres of learning.

Recently, the National Skill Development Corporation (NSDC) in India and Microsoft announced a collaboration aimed at providing digital skills to over 100,000 youth in the country over

the course of one year. Microsoft Learn resource centre will thus be integrated with the eSkill India digital platform to provide access to personalised learning and in-demand skills.

With the coronavirus pandemic, the need to efficiently adopt and improve remote learning methods has become more indispensable than
