nection might result in an electrical short circuit. When you are sure that all the connections are correct, power on Arduino and relay module with 5V DC, and then plug AC appliances connected to the relay for switching.

When you touch the off button on the touch panel (refer Fig. 1), the relay turns off the electrical appliance connected to it. When you touch the on button, it will switch on the electrical appliance connected to it.

This project is designed to control two electrical appliances. First two control buttons (on and off) in the first row of the touch panel shown in Fig. 1 are for the first appliance and control buttons in the next row are for second appliance.

Next, control the electrical appliances through the Android app (refer Fig. 19). Open the TouchSwitch app and click on the Bluetooth icon button to connect your mobile phone with Bluetooth HC-05. Then click on the on/off button in the app to control electrical appliances wirelessly. **EFY**
