

artificial intelligence (AI), the Internet of Things (IoT), and deep learning methods help analyse the data more accurately. AI is being used to predict and monitor the spread of the disease across countries, track the news regarding the number of confirmed cases of coronavirus, and predict the survival chance of patients with severe coronavirus symptoms.

Machine learning is specifically being used on CT scan data to detect coronavirus in patients. There are also a number of biosensors being used in molecular diagnostic platforms within hospitals to help determine if a patient has coronavirus. So, while temperature sensors are one of the main tools being used to fight Covid-19, there are a number of electronic gadgets and software programs that are being used at different stages of the fight. The information gained at all stages of detection and care is vital for developing effective treatments, therapies, and vaccines in the near future.

Robotics and drones. Robotics has emerged as one of the key technologies in the fight against Covid-19. Not only municipalities are using robots for disinfection of places in a fast and

safe manner, but a large number of hospitals across the globe are also using robots to provide support to healthcare workers and patients as well. Robots are also helping in delivering medicines and food supplies to coronavirus patients.

Similarly, drones are also being used to carry test kits and medical

supplies. These are also being used to spray disinfecting chemicals in public spaces. Drones equipped with thermal imaging technology are being used to detect people with fever/flu symptoms.

Some electronic devices to tackle coronavirus

Companies, researchers and scientists around the world are busy developing new gadgets to help fight Covid-19 pandemic. Here's a list of some electronic devices (some of which are already available) that could help tackle coronavirus:

- A gadget that helps open a door without touching the handle
- A device having a chemical-free ozone technology that disinfects vegetables and fruits by removing harmful pesticides, chemicals, etc. With this device, vegetables and fruits can become safer for consumption.
- A self-cleaning water bottle is a great way to ensure that drinking water is safe during the pandemic.
- The graphene industry is trying to develop sensors that can be used to detect Covid-19. The USA has already announced that it is working on a graphene biosensor that can run tests for several different viruses simultaneously and is very inexpensive.
- The power of IoT and accurate data analytics can help track down and significantly reduce the infection rate of this virus. **EFY**
