

Need For Touchless Technologies To Safeguard Against Viruses

Rathan Natarajan
is assistant professor at
Hindustan Institute of
Technology

We have intelligent devices like smartphones, smart TVs, computers, and robots in use that need not be touched for operation. In fact, many more things need to be operated without touching through voice control and gestures, etc, such as ATM machines and check-in counters at airports

Scientists believe that as the hole in the ozone layer in Earth's stratosphere collapses, the sun's rays will strike the earth directly and cause new deadly diseases. Many diseases have developed and disappeared in the past, but Covid-19 infection remains a challenge for us at

present. The disease is unlikely to go away soon; some medical professionals believe that it may not go away at all and could continue to stay with us for long. This means we have to get used to living with this infection.

No one is certain, in spite of popular theories, where the infection originated
