

swivel to face the opposite direction for convenient sharing of information with an office colleague. This unit's USB-C One Cable solution provides 4K imaging, fast data transfer and power for laptop charging through a single, convenient cable. Price of this monitor is yet to be unveiled.

Kandao Meeting 360° all-in-one conferencing camera. Kandao Meeting is an artificial intelligence (AI)-based intelligent 360° video-conferencing camera, designed to enhance efficiency of remote col-

laboration. Equipped with two fish-eye lenses, eight omni-directional microphones and two full-duplex speakerphones, Kandao Meeting can capture all attendees at 8K resolution with clear audio, while dynamically locating and tracking active speakers by AI recognition to make video-conferencing wiser. It will be available for US\$ 659.

Additional products and solutions

Some other interesting products unveiled at CES this year are:

Samsung Portable SSD T7 Touch. Samsung unveiled its new portable SSD T7 Touch, the successor to T5 portable SSD. According to Samsung, T7 is two times faster than T5, but the major uniqueness of T7 is its security as it is furnished with fingerprint

sensor for verification. It has a metallic surface and still has a compact form factor. The company further claims that T7 offers write and read speeds of

1000Mbps and 1050Mbps, respectively. Best performance can be achieved when the device is used with NVMe interface. It is expected to be available in major markets soon, including India. Price starts at US\$ 129.99.

Diesel On Fadelite Wear OS smartwatch. Diesel continues to push the limits of design with Diesel On Fadelite. This unisex touchscreen smartwatch comes with a transparent strap that is striking to the eye and exceptionally comfortable on the wrist. It also expands on Diesel's popular interactive dials with its Globe dial that can be rotated to show two additional time zones.

The watch is dependent on Qualcomm Snapdragon Wear 3100 platform and operates on Wear OS launched by Google. It comes in four colour variants: red to black, black to clear, blue to clear, and an all-clear variety coupled with an iridescent case and transparent strap. It is priced at US\$ 275.

Google Assistant's new features. This year at CES the search engine giant unleashed several new features for its Google Assistant, which is now available in more than ninety countries and helps more than 500 million people every month. It also introduced a new granular control of smart home devices, known as scheduled actions, using which users will be able to ask

the assistant to turn on/off or start/stop a compatible smart device at any time of choice.

For example, the user can say, "Hey Google, run the coffee maker at 6am," and it will do the job. And from within Google Home app, the user can control more than twenty new devices, including AC units, air purifiers, bathtubs, coffee makers, vacuums and more, all from one place.

Smart glasses. Norm Glasses are everyday augmented reality (AR) smart glasses that appear indistinguishable from normal sunglasses, featuring Android-based OS, voice user interface, dual speakers, camera and a head-up display that can show digital content in user's field-of-view (FOV).

All common lenses on the market are supported, including prescription lenses, photochromic lenses, polarized lenses, etc. Lenses can be changed by a local optometrist. Norm Glasses pair via Bluetooth with Android or iOS smartphones, enable people to interact with the digital world in a head-up and hands-free manner, and improve productivity. These also provide captioning for the hearing-impaired, and enable them to interact with digital content with voice, or to get help from a remote assistant.

Apart from Norm glasses, French startup Elcie Healthy also showcased its new optical frames that offer drowsiness alerts for drivers and can also help detect falls in elderly people.

A different kind of smart eyewear from US startup Narbis uses neuro-feedback for brain exercises, which can help boost concentration, notably for children with attention deficit disorders. Using a NASA-developed algorithm, the glasses become tinted when the wearer is distracted, and clear when calm and concentrating, states *Agence France-Presse*. **EFY**
