Smartwatch versus fitness band

dedicated fitness tracker shall suffice.

A fitness tracker feeds distance and exercise data into an app to give insight into overall health and progress. Some trackers also display time and notifications from the phone, similar to smartwatches; but these have smaller screens and are simply built compared to smartwatches.

A smart fitness tracker is compact and gives detailed information about the body, both while at rest and when exercising. Rather than giving loads of detail on a screen, it connects to a phone or computer, and lets the user see the progress, time, distance and other information about the workout. It can also be used to check improvements.

A smartwatch has a processor and touchscreen for the watch face. The user can download new faces to alter the appearance of the touchscreen.

Unlike a regular watch, a smartwatch can tell more than just time. It can track fitness and also send alerts about text messages, emails, notifications, timers, alarms, calls (some may even allow picking the call) and time. It also tracks running routes with GPS, controls music, sets fitness goals, monitors sleeping time and watches the heartrate.

A smartwatch has health-monitoring apps and various tracking capabilities for fitness purposes. But these are in addition to the main communication function that these offer.

A smartwatch may be able to receive notifications on some devices, but these features are not the most prominent in a fitness tracker.

Some smartwatches let the users view and respond to notifications, dictate text or email responses, or send smart replies, along with fitness and activity tracking. Wear OS by Google includes a host of features that could narrow the gap between functionality of fitness trackers and smartwatches. Wear OS devices allow adding apps directly to the smartwatch, and using any Bluetooth or Wi-Fi connection to perform a lot of functions independently.

More advanced devices support multi-sport tracking or exercise, such as running, cycling, swimming or golf.

Smartwatches are built for communication while fitness trackers are built for monitoring and data gathering. Both can help measure and assess health progress and keep the user motivated at the same time. Both devices may also offer similar tracking and data collection functions with a touchscreen for interface.

The technology behind a smartwatch or fitness tracker is great, but the ultimate goal is a better you. You still need to get out and run, exercise and go for walks. If a fitness tracker or smartwatch helps you achieve your goals, remind you of your daily tasks and track your health, then it is a smart investment. **EFY**
