

## Invisible computing startup unveils AR smart contact lens

Mojo Vision, a startup focused on invisible computing has unveiled a smart contact lens that delivers an augmented reality (AR) display in the user's field-of-vision. Mojo Vision contact lens offers a display with information and notifications, and allows the user to interact by focusing on certain points.

The rigid contact lens, which the company has been developing in stealth mode for some ten years, may also be used to help people with visual impairments by using enhanced image overlays.

In a demonstration to an *AFP* reporter, company executives showed how the contact lens could enable users to see a virtual teleprompter, navigation instructions or other interactions that appear floating in the field-of-vision by projecting a micro-LED display to the retina.

The user, wearing two lenses that may be fitted with a correction prescription, could click by concentrating on an icon to launch a music player, for example, and turn it off by looking away.

The company has received approval from US Food and Drug Administration as a breakthrough device to test the contact lens to help people with visual impairments such as macular degeneration or retinitis pigmentosa.

The company said the contact lens is designed to provide overlays that augment sight for people with low vision, and may assist in mobility, reading and other functions. The contact lens aims to enable people to move away from physical devices and interact more naturally with technology. It also could have business applications, allowing workers or specialists access to real-time information in their field-of-vision without a bulky headset.

## Panasonic develops world's first UHD HDR VR glasses

Panasonic unveiled the world's first high dynamic range (HDR)-capable virtual reality (VR) goggles at CES 2020. The technology allows the wearer to view high-quality content in a compact and lightweight design with an eyeglass-like shape.

The glasses are equipped with micro OLED panels that eliminate the screen door effect, where fine lines separating pixels become visible in the displayed image. Panasonic worked with 3M and Massachusetts-based Kopin Corp. to develop an optical module that allows display of natural and distortion-free images in a super single focus.

The VR glasses are equipped with earbuds on each of the straps, which the Japanese firm said were designed to make 'users feel as if they are wearing eyeglasses.' Meanwhile, adoption of technics' original dynamic driver using magnetic fluid allows accurate stroke of the diaphragm and achieves ultra-low distortion reproduction.

Panasonic has used their knowledge in other technological areas to compact the VR headset design into a lightweight body that resembles a pair of glasses, enabling the device to be worn in comfort and without the need of a head strap (Credit: [www.theverge.com](http://www.theverge.com))

## Reverse microwave that can chill wine and beer in minutes

Invented by Akram Boukai, Juno chiller works by rapidly spinning a can of fizzy drink or bottle of wine, which improves the heat transfer away from the liquid. For a beer this happens in less than a minute, for champagne it can take three to five. A light-up bar neatly illustrates the drink getting colder, and it does not explode when opened.

*Juno uses innovative MATRIX-powered thermoelectric technology to rapidly cool the drinks, without the use of noisy compressors or harmful chemical refrigerants (Credit: [www.indiegogo.com](http://www.indiegogo.com))*

The universal design allows for just about any type of beverage bottle or vessel to be placed inside for rapid cooling. From a can of soda to a bottle of champagne, Juno can accommodate a wide variety of containers.

Three simple and programmable buttons come preset for the perfect red or white wine temperatures, and are also customisable so the user can choose the preferred level of chilling. Once Juno has been initiated, it is always on and ready for another bottle.
