

## COMPONENTS

### IGBT chip

Infineon Technologies has introduced the new IGBT7 chip for its Easy housing platform. Now, it is taking the state-of-the-art TRENCHSTOP IGBT7 to the arena of medium power, in the standard industry package EconoDUAL 3. In this chip technology, the 1200V module provides a leading nominal current of 900A, enabling a thirty per cent higher inverter output current for the same frame size as compared with the former technology. While specific improvements of the module's chip and housing directly aim at industrial drive applications, it can also be well-implemented in designs for commercial, construction and agricultural vehicles (CAVs), servo drives, as well as solar and UPS inverters.

### Isolated gate driver

With MAX22701E isolated gate driver from Maxim Integrated Products, designers of high-voltage/high-power systems can improve power supply efficiency

by up to four percentage points over competitive solutions, reducing power loss and the resulting carbon footprint by thirty per cent. The driver IC is intended for use in switch-mode power supplies within industrial communication systems for solar power inverters, motor drives, electric cars, energy storage systems, uninterrupted power supplies, data farms and high-power/high-efficiency power supplies.

### DC/DC regulators

Analog Devices has introduced LTM4668 and LTM4668A  $\mu$ Module regulators, quad-output DC/DC

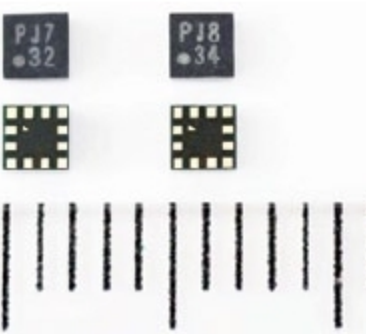

regulators with up to 4.8A output capability. The new devices integrate switching controllers, power FETs, inductors and support components, easing the design process while reducing power consumption and board space. These are ideal for telecom, networking and industrial applications.

Operating over an input voltage range of 2.7V to 17V, LTM4668 and LTM4668A support an output voltage range of 0.6V to 5.5V. The devices support frequency synchronisation, PolyPhase operation, selectable Burst Mode operation, hundred per cent duty cycle and low IQ operation. Their high switching frequency and a current mode architecture enable a very fast transient response to line and load changes without sacrificing stability.

### Accelerometers

In recent years, as factories have begun to save labour costs and increase efficiency, the concept of predictive maintenance for detecting abnormalities before equipment malfunctions has gained broad acceptance. This has increased the need for machine health monitoring using sensors to detect equipment

conditions (that is, motor vibration). ROHM Group company Kionix recently

announced the availability of accelerometers, KX132-1211 and KX134-1211, which are ideal for high accuracy, low-power motion sensing applications in the industrial equipment and consumer wearable markets.

### SoC FPGA

The trend towards compute intensive gateways and Edge devices is driving the integration of traditional deterministic control applications with additional embedded processing capabilities needed for smart and secure connected systems. In response, Microchip Technology is opening the Early Access

Program for PolarFire system-on-chip (SoC) field programmable gate array (FPGA). The platform offers the world's first hardened real-time, Linux-capable, RISC-V-based microprocessor subsystem on the mid-range PolarFire FPGA family, bringing class-leading low power consumption, thermal efficiency and defence-grade security to embedded systems.

### DC/DC converters

Introducing two new isolated DC/DC converter series in the industrial segment, TEN 40E and TEN 40WIE round

out Traco Power's existing forty-watt product range. Driven by current market trends, these series were developed to maximise quality and cost-efficiency in one product. Due to a new design approach, TEN 40E and TEN 40WIE, thus, offer a cost-efficient solution with
