

The Electronics Of Paranormal Manifestations

In future, will possible use of electromagnetic waves in the electromagnetic radiation spectrum allow supernatural forces to travel through optical fibres, coaxial cables used in TVs, and electrical and phone lines, which will make it easier to understand paranormal occurrences and then to sense, image and even talk to them?

Paranormal events (ghosts and spirits) have always been a point of discussion in almost every society whose existence is described as beyond normal experience or scientific explanation. In contrast to scientific hypothesis of evidence based on empirical observations and experimental data, existence of the paranormal does not have a base on

empirical evidence, but rather on anecdote, testimony and suspicion. Notable paranormal beliefs include those pertaining to extra-sensory perception (for example, telepathy), spiritualism, and the pseudo-science of ghost-hunting, crypto-zoology and ufology.

Scientifically, energy can neither be created nor destroyed but can change from one form to another.

If living soul is also a form of energy, then after death it will always be there in some form of energy. In the electronic era, when electronics-based technology has developed to provide many miraculous devices and their applications for the mankind covering almost every inch of the electromagnetic spectrum of radiations, it is expected that advances in electronic instrumentation will make it possible, one day, not only to record the existence of supernatural events but also to talk to them. This article is an effort to briefly summarise the latest developments in the field of electronic instrumentation towards sensing, imaging (terra-hertz and thermal) and recording paranormal events.

Electronics and the supernatural

We have seen developments in electronics from simple semiconductor
