dashboard. Click on the + New Bot icon on the top right-hand side to create a new bot.

- On the next screen, you will see that there is a set of predefined skills you can select. Select Greetings for the time being (Fig. 1). This bot is already trained to understand basic greetings.
- Provide a name for your bot. For now, since this is a very basic bot, you can have the bot crack some jokes. So let us name it Joke Bot and select the default language as English.
- Select Non personal data under the data policy since you won't be dealing with any sensitive information; then select the Public bot option and click on Create a bot.

So that's your bot created on the Recast platform.

The five stages of developing a bot

To use the words from the official Recast blog, there are five stages in a bot's life.

- Training - Teaching your bot what it needs to understand
- Building - Creating your conversational flow with the Bot Builder tool
- Coding - Connecting your bot with external APIs or a database
- Connecting - Shipping your bot to one or several messaging platforms
- Monitoring - Training your bot to make it sharper and get insights on its usage

Training a bot through intents

You will be able to see the options to either search, fork or create an intent in the dashboard.
