Recast also provides SDKs to develop custom channels.

Also, there is a ready-to-use Web chat provided by Recast (in the Connect tab). You can customise the colour schemes, headers, bot pictures, etc. It provides you with a script tag to be injected into the page. Your interface is now up (Fig. 12).

The Web chat code base is open sourced, which makes it easier for developers to play around with the look and feel, the standard response types and much more.

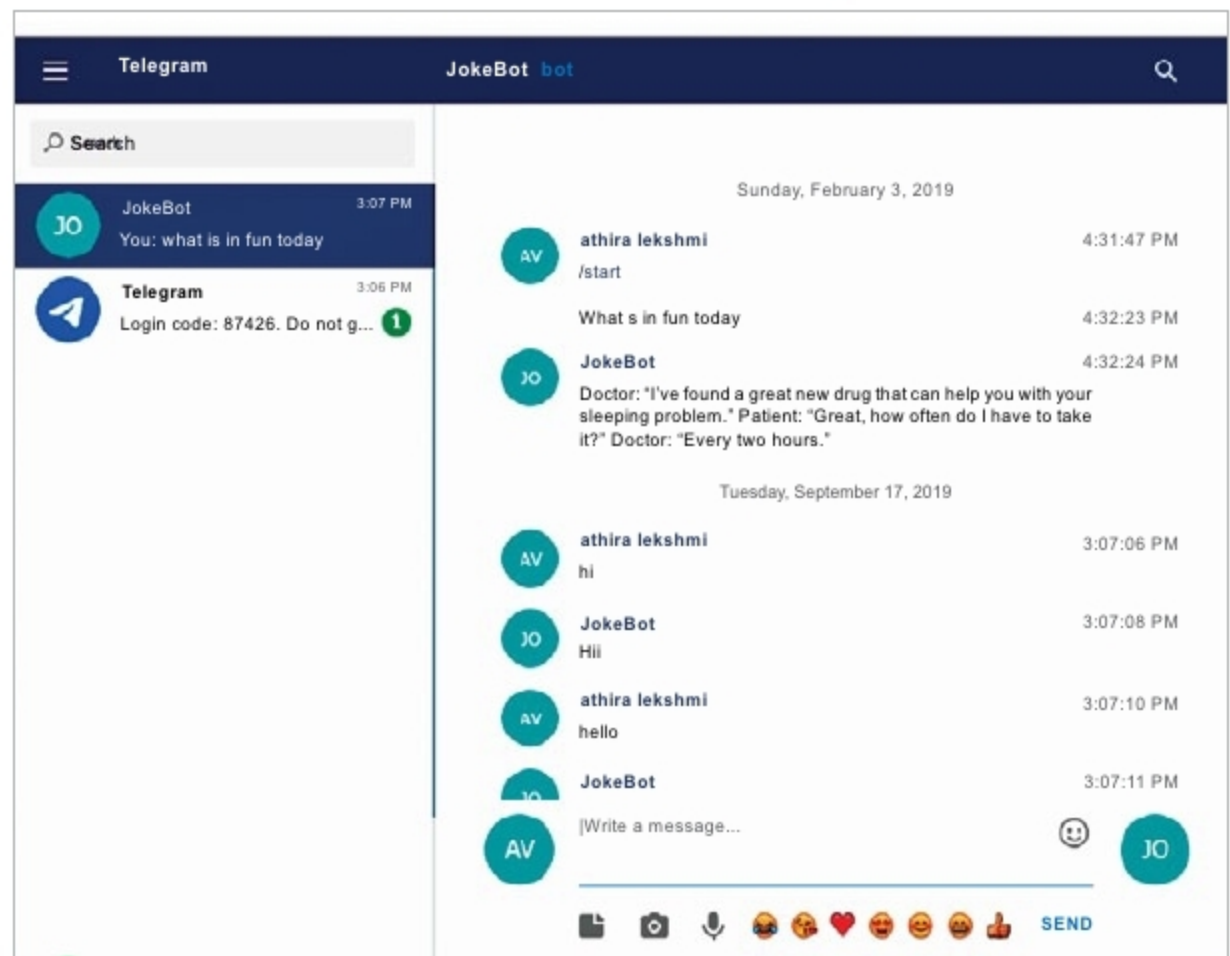

Fig. 14: Bot deployed in Telegram

The dashboard provides step-by-step procedures on how to deploy the bot on various channels. The joke bot was deployed in Telegram and in Web chat, as shown in Fig. 13.

And there is more

Recast supports multiple languages. Select one language as the base while creating the bot, but then you also have the option to add as many languages as you want.

The example considered here is a simple static joke bot, but actual use cases will need interaction with various systems. Recast has a Web hook feature which allows users to connect with various systems to get responses. Also, there is detailed API documentation to help leverage each independent feature of the platform.

As for analytics, Recast has a monitoring dashboard which helps
