AnyLogic

Visit: <https://www.anylogic.com>
Full version: Paid; free trial

Anylogic software for defence modelling and simulation provides a flexible virtual environment for faster analysis, testing, forecasting, and optimisation of complex processes, systems, and operations necessary to make the right decisions while mitigating risks involved. Modelling of systems required for military planning and management is done prior to their use in different applications, and their role and interoperability is tested. For disaster response scenarios, this is possible by considering environmental variables, human behaviour, and technology systems while creating testing responses.

EWare

Visit: <https://systematic.com/?lang=en>
Full version: Paid

EWare by Systematic is a standard-based, off-the-shelf software built for easy deployment in military organisations to help them make accurate tactical decisions to prevent loss of life and property while avoiding ambiguities. This powerful electronic warfare tool allows users to process data reliably before passing it to frontline units that include both day-to-day management and updating of mission-critical data. With improved threat identification, the team can minimise risk of such incidents. It can be customised to the geography of any planned mission.

IFS Maintenix

Visit: <https://www.ifs.com/corp>
Full version: Paid

IFS Maintenix is an easily scalable, end-to-end aviation maintenance management software that allows organisations to maximise the revenue potential of assets through standard and predictable maintenance. Users are provided with reliable and timely information, which improves their productivity and efficiency. The software has a component-based architecture featuring controlled workflow and point-of-maintenance access to real-time information, which enables working with any maintenance and engineering (M&E) system. Other features include automated planning, paperless execution, and compliance.

GeorbIS

Visit: <https://www.vizexperts.com>; **Full version:** Paid

GeorbIS is a 3D GIS (Geospatial intelligence) platform for visualisation, analysis, and development of data. The software helps to enhance the planning process of defence and paramilitary forces through several ways, such as the area of interest visualisation, real-time sensor data integration, terrain analysis, among others. Besides following global symbology standards like the MIL 2525D, it is OGC certified and also compatible with MIL symbology used by the Indian military along with support for the Indian Military Grid Reference System (IMGRS). It also helps in making intelligent decisions when it comes to forest management, oceanography, and disaster management.
