

RAIL-BOT robot to assist hospital staff in Covid-19 patient care

In light of the Covid-19 pandemic, Indian Railways has developed a robot to assist the management of medical wards in

serving medicines and food to patients. The robot, named RAIL BOT (R-BOT), has been developed to assist in hospital management functions towards patient care.

According to a press release, before being deployed for use in Central Railway hospital, Secunderabad, R-BOT underwent extensive trials and demonstrations. The robot is now used to provide medical accessories or equipment, medicines, and serve food to patients in the hospital without any need for physical contact.

With the help of this robot, doctors, nurses, and other medical staff can stay away from the risk of contracting Covid-19 infection. R-BOT is operated through a unique mobile app that has been developed as part of the innovation, supported by the Wi-Fi facility. It supports sensor-based features, which are capable of reading patients' body temperature and transmitting the same for displaying on mobile phones. In case of any abnormal high-temperature reading, R-BOT is capable of raising an alarm to alert the medics attending patients.

Beware of phishing attacks in the name of Aarogya Setu app

Phishing attacks in the name of Aarogya Setu app are on the rise, as cybercriminals are taking advantage of the Covid-19 pandemic for their vested interests. In its latest warning, Indian Computer Emergency Response Team (CERT-IN) says there has been a major increase in phishing attacks in the name of this contact tracing app, as well as video calling apps such as Zoom, Microsoft Teams, and Google Meet.

It turns out that scammers impersonate World Health Organization (WHO), HR divisions and top corporate executives, or anyone else you may know to spread fake apps and links to those famous apps that indicate your neighbour is infected, someone who came in contact with you tested positive, recommendations to self-isolate and guidelines to use Aarogya Setu app.

The most common type of phishing comes from websites that impersonate the bank or credit card company of a recipient, hoping to obtain personal financial information. Phishing is a cybercrime in which someone posing as a legitimate entity approaches a target via email, telephone, or text message and is tricked into sharing personal information such as banking

and credit card data.

Aarogya Setu app has been in the controversy surrounding its security of the data provided by the users as well as privacy concerns. The app, however, has crossed a hundred million milestone after it was launched to enhance the country's contact tracing capabilities amid the widespread coronavirus infections in the country.
