

You Can Travel In Drones And Eat Them Too

With the introduction of artificial intelligence and hybrid technologies, the future of drones is not just limited to taking great live aerial photos and videos, now these can also be used for personal transportation and commercial aviation, and even as food in case of emergency

Sani Theo

Is it not exciting to see a manned drone flying with a person onboard rolling and looping above buildings in mid-air? Yes, this is already happening in some countries. The first commercial drone capable of carrying a human was introduced by a Chinese company in 2016. Since then many companies across the globe have been designing and building various types of manned drones. Some companies have already succeeded in building passenger drones, while many are still into testing with humans onboard.

The future of drones is now not just limited to taking great live aerial photos, images, and videos, but these can also be

used for personal transportation and commercial aviation. Imagine your daily commute with no more traffic jams, no traffic lights, no road rages, and no delays. It wasn't that long ago when all this was just a dream or fiction, but thanks to artificial intelligence (AI) and hybrid technologies, it's all turning into a reality. This article covers the role of AI in drones, different types of hybrid drones, and their manufacturers.

Drones and AI

There are different types of drones including conventional drones, autonomous drones, hybrid power drones, hybrid vertical take-off and landing drones, and edible drones. It's
