

The Case For Responsible AI

Artificial Intelligence is becoming quite popular nowadays as it gives us significant technological power. However, it is important to use it with more responsibility to overcome its disruptive impacts such as loss of privacy, and increased biases in decision-making. Responsible AI would ensure ethical and transparent use of AI technologies

In my view, tools and systems are not hurtful; people using them are! The thing with technology is if you learn to use it, it works for you. But, 'who' you are decides 'how' you use it.

One of the things that distinguish humans from others is our freedom to decide how we act. Whatever we choose, we could always have chosen differently.

Responsible artificial intelligence (AI) is not a better technology—it is how we choose to make it and use it.

AI is giving us significant technological power, which begets greater responsibility.

These days, AI is raising more concerns because of the potentially disruptive impact it can create on many fronts. Matters such as massive workforce displacement, loss of privacy, increased biases in decision-making, and general lack of control over automated systems or robots. These issues are significant, and

they are also addressable—if we approach with the right planning, oversight, and governance.

Responsible AI is a framework for bringing several critical practices together, where we can ensure ethical, transparent, and accountable use of AI technologies. Their use in a manner that is consistent with user expectations, organisational values, as well as societal laws and norms.

For example, under normal circumstances, mis-selling, especially in the financial services domain, is dealt with utmost caution. The government would step in if the consequences are grave. If a person, i.e., a human does it, you may reprimand them or have some consequences attached. How would you do that when so-called intelligent chatbots are being used to sell something to customers? Suing the salesperson is already stressful, can you think of doing that to a chatbot? Misrepresentation

is about what a person said to you. What happens when we're not being sold to by a human at all?

So, understanding and acknowledging that these types of scenarios may exist with your product or service and taking adequate steps to deal with them in the ethically right manner is Responsible AI.

The foundational elements of Responsible AI

Some of the foundational elements have to be timeless and deeply rooted in organisations' fabric.

Elements such as—moral purpose and society benefit, accountability, transparency and
