

commented - he said, "Even if you give us two hours back in the day, what will we do with it? And because that question is not being answered, we will end up consuming that time in just expanding our existing work."

That was a light bulb moment; we realised that while we were freeing up their time, we must also ensure that their free time is repurposed for something else, something better.

On the same note, I believe that people are not afraid of losing jobs as such. They are uncomfortable because they do not know what to do with excess time at hand—it bothers them!

So, the best way to unlock the full potential of the workforce would be to gift each of your employees one of the AI bots, like a personal AI assistant, that can do their grunt work. Then, enable your employees to control those systems effectively and allow them to spend the rest of their time ideating or working strategically.

You can encourage their creativity by taking away mundane and grunt workload. And then provide autonomy to come up with ideas, and also offer them with testbed to validate those ideas.

Responsible AI versus Explainable AI

Some people often confuse Responsible AI with Explainable AI. So, let me give an analogy here. Explainable AI is much like Air Crash Investigation, which is necessary and useful after the fact, but of no use at all to avoid that accident.

Responsible AI is about avoiding that crash in the first place.

When we talk about explainable AI, it is still about being technically thorough. It is about being able to understand what happened, how it happened, and why it happened. And, having an auditable system in place, where you can investigate, after the fact, find out how every step was carried out.

Responsible AI, on the contrary, is being ethically, socially, and morally thorough. It is about being able to control desires, put them second by placing human and societal interest first.

Fig. 3: You can develop and use AI responsibly if you know the risks. But first, you must understand them better and specific to your use case or context

Both are indeed necessary and have an essential place in the ecosystem.

The case for Responsible AI is stronger

Whenever technology intersects with humans—it calls for attention. Not only attention but ethical and responsible approaches.

In the last couple of years, I realised that there is a lot of AI hyperbole. And, this hyperbole has given rise to 'AI solutionism' mindset. This mindset makes people believe that if you give them enough data, their machine learning algorithms can solve all of humanity's problems. People think that throwing more data is the answer, the quality of data is not essential.

We already have seen the rise of a similar mindset a few years ago - something that I would call as "there is an app for it" mindset. We know that it hasn't done any good in real life to anyone.

Instead of supporting any progress, this type of mindset usually endangers the value of emerging technologies, and it also sets unrealistic expectations. AI solutionism has also led to a reckless push to use AI for anything and everything. And because of this push, many companies have taken a fire-aim-ready approach. It is not only detrimental

to the company's growth, it is also dangerous for customers on many levels.

A better approach would be to consider suitability, applicability, and apply some sanity, do what is necessary. However, this fear of missing out (FOMO) is leading to several missteps, and that is, in-turn creating a substantial intellectual debt, where we do first and think later.

Fear of missing out often creates substantial intellectual debt.

One of the many ways to handle this is by being responsible with technology, especially with AI.

The problem with the Responsible AI paradigm is that everyone knows 'why' it is necessary, but no one knows 'how' to do it. That prompted me to write a book, *Keeping Your AI Under Control*.

In this book, I explain 'how' part of the Responsible AI. If companies agree that Responsible AI is necessary, this book will guide them on how to achieve it.

I also talk about AI insurance in the book, where, in some cases, it would be helpful to provide remediation to some of the effects of stupid AIs out there.

Remember, you can develop and use AI responsibly if you know the risks. But first, you must understand them better and specify to your use case or context. **EFY**
